2000 *Mathematics Subject Classification.* 54J05, 54A05, 54D99, 54E05, 54E15,
54E17, 54E99

Key words and phrases. algebraic general topology, quasi-uniform spaces,
generalizations of proximity spaces, generalizations of nearness spaces,
generalizations of uniform spaces

ABSTRACT. Partial rough draft of volume 2 of Algebraic General Topology
book. This volume is meant to contain materials which refer to more advanced
prerequisites than plain ZFC (such as category theory and classical pointfree
topology). This is a **very** rough draft.

CHAPTER 1

Introduction

I remind some definitions from volume 1 [5].

I denote a set definition like $\left\{ \frac{x \in A}{P(x)} \right\}$ instead of customary $\{x \in A \mid P(x)\}$ (in order to reduce formulas size).

I denote partial order as \sqsubseteq . I denote lattice operations as \sqcap , \sqcup , \sqcap , \sqcup .

The following generalizes monovalued morphisms in category **Rel**.

Let Hom-sets be complete lattices.

DEFINITION 1822. A morphism f of a partially ordered category is *metamonovalued* when $(\sqcap G) \circ f = \sqcap_{g \in G} (g \circ f)$ whenever G is a set of morphisms with a suitable domain and image.

DEFINITION 1823. A morphism f of a partially ordered category is *metainjective* when $f \circ (\sqcap G) = \sqcap_{g \in G} (f \circ g)$ whenever G is a set of morphisms with a suitable domain and image.

OBVIOUS 1824. Metamonovaluedness and metainjectivity are dual to each other.

DEFINITION 1825. A morphism f of a partially ordered category is *metacomplete* when $f \circ (\sqcup G) = \sqcup_{g \in G} (f \circ g)$ whenever G is a set of morphisms with a suitable domain and image.

DEFINITION 1826. A morphism f of a partially ordered category is *cometacomplete* when $(\sqcup G) \circ f = \sqcup_{g \in G} (g \circ f)$ whenever G is a set of morphisms with a suitable domain and image.

Let now Hom-sets be meet-semilattices.

DEFINITION 1827. A morphism f of a partially ordered category is *weakly metamonovalued* when $(g \sqcap h) \circ f = (g \circ f) \sqcap (h \circ f)$ whenever g and h are morphisms with a suitable domain and image.

DEFINITION 1828. A morphism f of a partially ordered category is *weakly metainjective* when $f \circ (g \sqcap h) = (f \circ g) \sqcap (f \circ h)$ whenever g and h are morphisms with a suitable domain and image.

Let now Hom-sets be join-semilattices.

DEFINITION 1829. A morphism f of a partially ordered category is *weakly metacomplete* when $f \circ (g \sqcup h) = (f \circ g) \sqcup (f \circ h)$ whenever g and h are morphisms with a suitable domain and image.

DEFINITION 1830. A morphism f of a partially ordered category is *weakly cometacomplete* when $(g \sqcup h) \circ f = (g \circ f) \sqcup (h \circ f)$ whenever g and h are morphisms with a suitable domain and image.

OBVIOUS 1831.

1°. Metamonovalued morphisms are weakly metamonovalued.

2°. Metainjective morphisms are weakly metainjective.

3°. Metacomplete morphisms are weakly metacomplete.

4°. Co-metacomplete morphisms are weakly co-metacomplete.

DEFINITION 1832. For a partially ordered dagger category I will call *monovalued* morphism such a morphism f that $f \circ f^\dagger \sqsubseteq 1_{\text{Dst } f}$.

DEFINITION 1833. For a partially ordered dagger category I will call *entirely defined* morphism such a morphism f that $f^\dagger \circ f \sqsupseteq 1_{\text{Src } f}$.

DEFINITION 1834. For a partially ordered dagger category I will call *injective* morphism such a morphism f that $f^\dagger \circ f \sqsubseteq 1_{\text{Src } f}$.

DEFINITION 1835. For a partially ordered dagger category I will call *surjective* morphism such a morphism f that $f \circ f^\dagger \sqsupseteq 1_{\text{Dst } f}$.

REMARK 1836. It is easy to show that this is a generalization of monovalued, entirely defined, injective, and surjective functions as morphisms of the category **Rel**.

OBVIOUS 1837. “Injective morphism” is a dual of “monovalued morphism” and “surjective morphism” is a dual of “entirely defined morphism”.

Products in dagger categories with complete ordered Hom-sets

FiXme: This is a rough draft. It is not yet checked for errors.

NOTE 1838. What I previously denoted $\prod F$ is now denoted $\prod^{(L)} F$ (and likewise for \coprod). The other draft chapters referring to this chapter may be not yet updated.

PROPOSITION 1839. **FiXme:** Should we move this to volume 1?

- 1°. Every entirely defined monovalued morphism is metamonovalued and metacomplete.
- 2°. Every surjective injective morphism is metainjective and co-metacomplete.

PROOF. Let's prove the first (the second follows from duality):

Let f be an entirely defined monovalued morphism.

$(\prod G) \circ f \sqsubseteq \prod_{g \in G} (g \circ f)$ by monotonicity of composition.

Using the fact that f is monovalued and entirely defined:

$$\left(\prod_{g \in G} (g \circ f) \right) \circ f^\dagger \sqsubseteq \prod_{g \in G} (g \circ f \circ f^\dagger) \sqsubseteq \prod G;$$

$$\prod_{g \in G} (g \circ f) \sqsubseteq \left(\prod_{g \in G} (g \circ f) \right) \circ f^\dagger \circ f \sqsubseteq (\prod G) \circ f.$$

So $(\prod G) \circ f = \prod_{g \in G} (g \circ f)$.

Let f be a entirely defined monovalued morphism.

$f \circ (\sqcup G) \supseteq \sqcup_{g \in G} (f \circ g)$ by monotonicity of composition.

Using the fact that f is entirely defined and monovalued:

$$f^\dagger \circ \left(\sqcup_{g \in G} (f \circ g) \right) \supseteq \sqcup_{g \in G} (f^\dagger \circ f \circ g) \supseteq \prod G;$$

$$\sqcup_{g \in G} (f \circ g) \supseteq f \circ f^\dagger \circ \sqcup_{g \in G} (f \circ g) \supseteq f \circ (\sqcup G).$$

So $f \circ (\sqcup G) = \sqcup_{g \in G} (f \circ g)$. □

1. General product in partially ordered dagger category

To understand the below better, you can restrict your imagination to the case when \mathcal{C} is the category **Rel**.

1.1. Infimum product. Let \mathcal{C} be a dagger category, each Hom-set of which is a complete lattice (having order agreed with the dagger).

We will designate some morphisms as *principal* and require that principal morphisms are both metacomplete and co-metacomplete. (For a particular example of the category **Rel**, all morphisms are considered principal.)

Let $\prod^{(Q)} X$ be an object for each indexed family X of objects.

Let π be a partial function mapping elements $X \in \text{dom } \pi$ (which consists of small indexed families of objects of \mathcal{C}) to indexed families $\prod^{(Q)} X \rightarrow X_i$ of principal morphisms (called *projections*) for every $i \in \text{dom } X$.

We will denote particular morphisms as π_i^X .

REMARK 1840. In some important examples the function π is entire, that is $\text{dom } \pi$ is the set of all small indexed families of objects of \mathcal{C} . However there are also some important examples where it is partial.

DEFINITION 1841. *Infimum product* $\prod F$ (such that π is defined at $\lambda j \in n : \text{Src } F_j$ and $\lambda j \in n : \text{Dst } F_j$) is defined by the formula

$$\prod^{(L)} F = \prod_{i \in \text{dom } F} ((\pi_i^{\lambda j \in n : \text{Dst } F_j})^\dagger \circ F_i \circ \pi_i^{\lambda j \in n : \text{Src } F_j}).$$

This formula can be (over)simplified to:

$$\prod^{(L)} F = \prod_{i \in \text{dom } F} ((\pi_i^{\text{Dst } \circ F})^\dagger \circ F_i \circ \pi_i^{\text{Src } \circ F}).$$

REMARK 1842. $(\pi_i^{\lambda j \in n : \text{Dst } F_j})^\dagger \circ F_i \circ \pi_i^{\lambda j \in n : \text{Src } F_j} \in \text{Hom}(\prod_{j \in n}^{(Q)} \text{Src } F_j, \prod_{j \in n}^{(Q)} \text{Dst } F_j)$ are properly defined and have the same sources and destination (whenever $i \in \text{dom } F$ is), thus the meet in the formulas is properly defined.

REMARK 1843. Thus

$$F_0 \times^{(L)} F_1 = ((\pi_0^{(\text{Dst } F_0, \text{Dst } F_1)})^\dagger \circ F_0 \circ \pi_0^{(\text{Src } F_0, \text{Src } F_1)}) \sqcap ((\pi_1^{(\text{Dst } F_0, \text{Dst } F_1)})^\dagger \circ F_1 \circ \pi_1^{(\text{Src } F_0, \text{Src } F_1)})$$

that is product is defined by a pure algebraic formula.

$$\text{PROPOSITION 1844. } \prod^{(L)} F = \max \left\{ \frac{\Phi \in \text{Hom}(\prod_{j \in n}^{(Q)} \text{Src } F_j, \prod_{j \in n}^{(Q)} \text{Dst } F_j)}{\forall i \in n : \Phi \sqsubseteq (\pi_i^{\lambda j \in n : \text{Dst } F_j})^\dagger \circ F_i \circ \pi_i^{\lambda j \in n : \text{Src } F_j}} \right\}.$$

PROOF. By definition of meet on a complete lattice. \square

$$\text{COROLLARY 1845. } \prod^{(L)} F = \sqcup \left\{ \frac{\Phi \in \text{Hom}(\prod_{j \in n}^{(Q)} \text{Src } F_j, \prod_{j \in n}^{(Q)} \text{Dst } F_j)}{\forall i \in n : \Phi \sqsubseteq (\pi_i^{\lambda j \in n : \text{Dst } F_j})^\dagger \circ F_i \circ \pi_i^{\lambda j \in n : \text{Src } F_j}} \right\}.$$

THEOREM 1846. Let π_i^X be metamonovalued morphisms. If $S \in \mathcal{P}(\text{Hom}(A_0, B_0) \times \text{Hom}(A_1, B_1))$ for some sets A_0, B_0, A_1, B_1 then

$$\prod \left\{ \frac{a \times^{(L)} b}{(a, b) \in S} \right\} = \prod \text{dom } S \times^{(L)} \prod \text{im } S.$$

PROOF.

$$\begin{aligned} & \prod \left\{ \frac{a \times^{(L)} b}{(a, b) \in S} \right\} = \\ & \prod \left\{ \frac{((\pi_0^{(\text{Dst } a, \text{Dst } b)})^\dagger \circ a \circ \pi_0^{(\text{Src } a, \text{Src } b)}) \sqcap ((\pi_1^{(\text{Dst } a, \text{Dst } b)})^\dagger \circ b \circ \pi_1^{(\text{Src } a, \text{Src } b)})}{(a, b) \in S} \right\} = \\ & \prod \left\{ \frac{(\pi_0^{(\text{Dst } a, \text{Dst } b)})^\dagger \circ a \circ \pi_0^{(\text{Src } a, \text{Src } b)}}{a \in \text{dom } S} \right\} \sqcap \prod \left\{ \frac{(\pi_1^{(\text{Dst } a, \text{Dst } b)})^\dagger \circ b \circ \pi_1^{(\text{Src } a, \text{Src } b)}}{b \in \text{im } S} \right\} = \\ & ((\pi_0^{(\text{Dst } a, \text{Dst } b)})^\dagger \circ \prod \left\{ \frac{a}{a \in \text{dom } S} \right\} \circ \pi_0^{(\text{Src } a, \text{Src } b)}) \sqcap ((\pi_1^{(\text{Dst } a, \text{Dst } b)})^\dagger \circ \prod \left\{ \frac{b}{b \in \text{im } S} \right\} \circ \pi_1^{(\text{Src } a, \text{Src } b)}) = \\ & ((\pi_0^{(\text{Dst } a, \text{Dst } b)})^\dagger \circ (\prod \text{dom } S) \circ \pi_0^{(\text{Src } a, \text{Src } b)}) \sqcap ((\pi_1^{(\text{Dst } a, \text{Dst } b)})^\dagger \circ (\prod \text{im } S) \circ \pi_1^{(\text{Src } a, \text{Src } b)}) = \\ & \prod \text{dom } S \times^{(L)} \prod \text{im } S. \end{aligned}$$

\square

COROLLARY 1847. $(a_0 \times^{(L)} b_0) \sqcap (a_1 \times^{(L)} b_1) = (a_0 \sqcap a_1) \times^{(L)} (b_0 \sqcap b_1)$.

COROLLARY 1848. $a_0 \times^{(L)} b_0 \not\neq a_1 \times^{(L)} b_1 \Leftrightarrow a_0 \not\neq a_1 \wedge b_0 \not\neq b_1$.

1.2. Infimum product for endomorphisms. Let F is an indexed family of endomorphisms of \mathcal{C} .

I will denote $\text{Ob } f$ the object (source and destination) of an endomorphism f .

Let also π_i^X be a monovalued entirely defined morphism (for each $i \in \text{dom } F$).

Then $\prod^{(L)} F = \prod_{i \in \text{dom } F} ((\pi_i^{\lambda_j \in n: \text{Ob } F_j})^\dagger \circ F_i \circ \pi_i^{\lambda_j \in n: \text{Ob } F_j})$ (if π is defined at $\lambda_j \in n : \text{Ob } F_j$).

Abbreviate $\pi_i = \pi_i^{\lambda_j \in n: \text{Ob } F_j}$.

So $\prod^{(L)} F = \prod_{i \in \text{dom } F} ((\pi_i)^\dagger \circ F_i \circ \pi_i)$.

$$\prod^{(L)} F = \max \left\{ \begin{array}{l} \Phi \in \text{End} \left(\prod_{j \in n}^{(Q)} \text{Ob } F_j \right) \\ \forall i \in n: \Phi \sqsubseteq (\pi_i)^\dagger \circ F_i \circ \pi_i \end{array} \right\}.$$

Taking into account that π_i is a monovalued entirely defined morphism, we get:

$$\text{OBVIOUS 1849. } \prod^{(L)} F = \max \left\{ \begin{array}{l} \Phi \in \text{End} \left(\prod_{j \in n}^{(Q)} \text{Ob } F_j \right) \\ \forall i \in n: \pi_i \in \text{C}(\Phi, F_i) \end{array} \right\}.$$

REMARK 1850. The above formula may allow to define the product for non-dagger categories (but only for endomorphisms). In this writing I don't introduce a notation for this, however.

COROLLARY 1851. $\pi_i \in \text{C} \left(\prod^{(L)} F, F_i \right)$ for every $i \in \text{dom } F$.

1.3. Category of continuous morphisms. Let $\pi_i = \pi_i^X$ (for $i \in \text{dom } F$) be entirely defined monovalued morphisms (we suppose it is defined at X).

Let \otimes of an indexed family of morphisms is a morphism; $\pi_i \circ \otimes f = f_i$; $\otimes_{i \in n} (\pi_i \circ f) = f$.

DEFINITION 1852. The category $\text{cont}(\mathcal{C})$ is defined as follows:

- Objects are endomorphisms of the category \mathcal{C} .
- Morphisms are triples (f, a, b) where a and b are objects and $f : \text{Ob } a \rightarrow \text{Ob } b$ is an entirely defined monovalued principal morphism of the category \mathcal{C} such that $f \in \text{C}(a, b)$ (in other words, $f \circ a \sqsubseteq b \circ f$).
- Composition of morphisms is defined by the formula $(g, b, c) \circ (f, a, b) = (g \circ f, a, c)$.
- Identity morphisms are $(a, a, 1_a^{\mathcal{C}})$.

It is really a category:

PROOF. We need to prove that: composition of morphisms is a morphism, composition is associative, and identity morphisms can be canceled on the left and on the right.

That composition of morphisms is a morphism by properties of generalized continuity.

That composition is associative is obvious.

That identity morphisms can be canceled on the left and on the right is obvious. \square

REMARK 1853. The ‘‘physical’’ meaning of this category is:

- Objects (endomorphisms of \mathcal{C}) are spaces.
- Morphisms are continuous functions between spaces.
- $f \circ a \sqsubseteq b \circ f$ intuitively means that f combined with an infinitely small is less than infinitely small combined with f (that is f is continuous).

DEFINITION 1854. $\pi_i^{\text{cont}(\mathcal{C})} = \left(\prod^{(L)} F, F_i, \pi_i \right)$.

PROPOSITION 1855. π_i are continuous, that is $\pi_i^{\text{cont}(\mathcal{C})}$ are morphisms.

PROOF. We need to prove $\pi_i \in C\left(\prod^{(L)} F, F_i\right)$ but that was proved above. \square

LEMMA 1856. $f \in \text{Hom}_{\text{cont}(\mathcal{C})}\left(Y, \prod^{(L)} F\right)$ is continuous iff all $\pi_i \circ f$ are continuous.

PROOF.

\Rightarrow . Let $f \in \text{Hom}_{\text{cont}(\mathcal{C})}\left(Y, \prod^{(L)} F\right)$. Then $f \circ Y \sqsubseteq \left(\prod^{(L)} F\right) \circ f$; $\pi_i \circ f \circ Y \sqsubseteq \pi_i \circ \left(\prod^{(L)} F\right) \circ f$; $\pi_i \circ f \circ Y \sqsubseteq \left(\prod^{(L)} F\right) \circ \pi_i \circ f$. Thus $\pi_i \circ f$ is continuous.
 \Leftarrow . Let all $\pi_i \circ f$ be continuous. Then $\pi_i^{\text{cont}(\mathcal{C})} \circ f \in \text{Hom}_{\text{cont}(\mathcal{C})}\left(Y, F_i\right)$; $\pi_i^{\text{cont}(\mathcal{C})} \circ f \circ Y \sqsubseteq F_i \circ \pi_i^{\text{cont}(\mathcal{C})} \circ f$. We need to prove $Y \sqsubseteq f^\dagger \circ \left(\prod^{(L)} F\right) \circ f$ that is

$$Y \sqsubseteq f^\dagger \circ \prod_{i \in n} ((\pi_i)^\dagger \circ F_i \circ \pi_i) \circ f$$

for what is enough (because f is metamonvalued)

$$Y \sqsubseteq \prod_{i \in n} (f^\dagger \circ (\pi_i)^\dagger \circ F_i \circ \pi_i \circ f)$$

what follows from $Y \sqsubseteq \prod_{i \in n} (f^\dagger \circ (\pi_i)^\dagger \circ \pi_i \circ f \circ Y)$ what is obvious. \square

THEOREM 1857. $\prod^{(L)}$ together with \otimes is a (partial) product in the category $\text{cont}(\mathcal{C})$.

PROOF. Obvious.

Check <http://math.stackexchange.com/questions/102632/how-to-check-whether-it-is-a-direct-product/102677#102677> \square

2. On duality

We will consider duality where both the category \mathcal{C} and orders on Mor-sets are replaced with their dual. I will denote $A \xleftrightarrow{\text{dual}} B$ when two formulas A and B are dual with this duality.

PROPOSITION 1858. $f \in C(\mu, \nu) \xleftrightarrow{\text{dual}} f^\dagger \in C(\nu^\dagger, \mu^\dagger)$.

PROOF. $f \in C(\mu, \nu) \Leftrightarrow f \circ \mu \sqsubseteq \nu \circ f \xleftrightarrow{\text{dual}} \mu^\dagger \circ f^\dagger \sqsupseteq f^\dagger \circ \nu^{-1} \Leftrightarrow f^\dagger \in C(\nu^\dagger, \mu^\dagger)$. \square

f is entirely defined $\Leftrightarrow f^\dagger \circ f \sqsupseteq 1_{\text{Src } f} \xleftrightarrow{\text{dual}} f^\dagger \circ f \sqsubseteq 1_{\text{Src } f} \Leftrightarrow f$ is injective $\Leftrightarrow f^\dagger$ is monovalued.

f is monovalued $\Leftrightarrow f \circ f^\dagger \sqsubseteq 1_{\text{Dst } f} \xleftrightarrow{\text{dual}} f \circ f^\dagger \sqsupseteq 1_{\text{Dst } f} \Leftrightarrow f$ is surjective $\Leftrightarrow f^\dagger$ is entirely defined.

3. General coproduct in partially ordered dagger category

The below is the dual of the above, proofs are omitted as they are dual.

Let ι_i **FixMe: What is ι ?** are entirely defined monovalued morphisms to an object Z .

Let $\iota_i \xleftrightarrow{\text{dual}} \pi_i$ that is $\iota_i = (\pi_i)^\dagger$. We have the above equivalent to π_i being monovalued and entirely defined.

3.1. Supremum coproduct. Let \mathcal{C} be a dagger category, each Hom-set of which is a complete lattice (having order agreed with the dagger).

We will designate some morphisms as *principal* and require that principal morphisms are both metacomplete and co-metacomplete. (For a particular example of the category **Rel**, all morphisms are considered principal.)

Let $\coprod^{(Q)} X$ be an object for each indexed family X of objects.

Let ι be a partial function mapping elements $X \in \text{dom } \iota$ (which consists of small indexed families of objects of \mathcal{C}) to indexed families $X_i \rightarrow \coprod^{(Q)} X$ of principal morphisms (called *injections*) for every $i \in \text{dom } X$.

DEFINITION 1859. *Supremum coproduct* $\coprod^{(L)} F$ (such that ι is defined at $\lambda j \in n : \text{Dst } F_j$ and $\lambda j \in n : \text{Src } F_j$) is defined by the formula

$$\coprod^{(L)} F = \bigsqcup_{i \in \text{dom } F} (\iota_i^{\lambda j \in n : \text{Src } F_j} \circ F_i^\dagger \circ (\iota_i^{\lambda j \in n : \text{Dst } F_j})^\dagger).$$

This formula can be (over)simplified to:

$$\coprod^{(L)} F = \bigsqcup_{i \in \text{dom } F} (\iota_i^{\text{Src } \circ F} \circ F_i^\dagger \circ (\iota_i^{\text{Dst } \circ F})^\dagger).$$

REMARK 1860. $\iota_i^{\lambda j \in n : \text{Src } F_j} \circ F_i \circ (\iota_i^{\lambda j \in n : \text{Dst } F_j})^\dagger \in \text{Hom}(\coprod_{j \in n}^{(Q)} \text{Src } F_j, \coprod_{j \in n}^{(Q)} \text{Dst } F_j)$ are properly defined and have the same sources and destination (whenever $i \in \text{dom } F$ is), thus the meet in the formulas is properly defined.

REMARK 1861. Thus

$$F_0 \amalg^{(L)} F_1 = (\iota_0^{(\text{Src } F_0, \text{Src } F_1)} \circ F_0^\dagger \circ (\iota_0^{(\text{Dst } F_0, \text{Dst } F_1)})^\dagger) \sqcup (\iota_1^{(\text{Src } F_0, \text{Src } F_1)} \circ F_1^\dagger \circ (\iota_1^{(\text{Dst } F_0, \text{Dst } F_1)})^\dagger)$$

that is coproduct is defined by a pure algebraic formula.

$$\text{PROPOSITION 1862. } \coprod^{(L)} F = \min \left\{ \frac{\Phi \in \text{End}(\coprod_{j \in n}^{(Q)} \text{Ob } F_j)}{\forall i \in n : \Phi \sqsubseteq \iota_i^{\lambda j \in n : \text{Src } F_j} \circ F_i^\dagger \circ (\iota_i^{\lambda j \in n : \text{Dst } F_j})^\dagger} \right\}.$$

PROOF. By definition of meet on a complete lattice. \square

$$\text{COROLLARY 1863. } \coprod^{(L)} F = \prod \left\{ \frac{\Phi \in \text{End}(\coprod_{j \in n}^{(Q)} \text{Ob } F_j)}{\forall i \in n : \Phi \sqsubseteq \iota_i^{\lambda j \in n : \text{Src } F_j} \circ F_i^\dagger \circ (\iota_i^{\lambda j \in n : \text{Dst } F_j})^\dagger} \right\}.$$

THEOREM 1864. Let π_i^X be metainjective morphisms. If $S \in \mathscr{P}(\text{Hom}(A_0, B_0) \times \text{Hom}(A_1, B_1))$ for some sets A_0, B_0, A_1, B_1 then

$$\bigsqcup \left\{ \frac{a \times^{(L)} b}{(a, b) \in S} \right\} = \bigsqcup \text{dom } S \times^{(L)} \bigsqcup \text{im } S.$$

$$\text{COROLLARY 1865. } (a_0 \amalg^{(L)} b_0) \sqcup (a_1 \amalg^{(L)} b_1) = (a_0 \sqcap a_1) \amalg^{(L)} (b_0 \sqcap b_1).$$

$$\text{COROLLARY 1866. } a_0 \amalg^{(L)} b_0 \equiv a_1 \amalg^{(L)} b_1 \Leftrightarrow a_0 \equiv a_1 \wedge b_0 \equiv b_1.$$

3.2. Supremum coproduct for endomorphisms. Let F be an indexed family of endomorphisms of \mathcal{C} .

I will denote $\text{Ob } f$ the object (source and destination) of an endomorphism f . Let also ι_i be a monovalued entirely defined morphism (for each $i \in \text{dom } F$).

DEFINITION 1867. $\coprod^{(L)} F = \bigsqcup_{i \in \text{dom } F} (\iota_i^{\lambda j \in n : \text{Ob } F_j} \circ F_i^\dagger \circ (\iota_i^{\lambda j \in n : \text{Ob } F_j})^\dagger)$ (if ι is defined at $\lambda j \in n : \text{Ob } F_j$). (I call it *supremum coproduct*).

Abbreviate $\iota_i = \lambda_{j \in n: \text{Ob } F_j}$.
 So $\coprod F = \bigsqcup_{i \in \text{dom } F} (\iota_i \circ F_i^\dagger \circ (\iota_i)^\dagger)$.
 $\coprod F = \min \left\{ \frac{\Phi \in \text{End}(\prod_{j \in n}^{(Q)} \text{Ob } F_j)}{\forall i \in n: \Phi \sqsupseteq \iota_i \circ F_i^\dagger \circ (\iota_i)^\dagger} \right\}$.

Taking into account that ι_i is a monovalued entirely defined morphism, we get:

$$\text{OBVIOUS 1868. } \coprod^{(L)} = \min \left\{ \frac{\Phi \in \text{End}(\prod_{j \in n}^{(Q)} \text{Ob } F_j)}{\forall i \in n: \iota_i \in C(F_i^\dagger, \Phi)} \right\}.$$

COROLLARY 1869. $\iota_i \in C(F_i, \coprod^{(L)} F)$ for every $i \in \text{dom } F$.

3.3. Category of continuous morphisms. Let ι_i (for $i \in \text{dom } F$) be entirely defined monovalued and metacomplete morphisms.

Let \oplus of an indexed family of morphisms is a morphism; $(\oplus f) \circ \iota_i = f_i$; $\oplus_{i \in n} (f \circ \iota_i) = f$ (a dual of the above).

Let $F_i \in \text{End}(\prod_{j \in n}^{(Q)} \text{Ob } F_j)$ for all $i \in n$ (where n is some index set) (a self-dual of the above).

DEFINITION 1870. $\iota_i^{\text{cont}(C)} = \left(\prod^{(L)} F, F_i^\dagger, \iota_i \right)$.

PROPOSITION 1871. ι_i are continuous, that is $\iota_i^{\text{cont}(C)}$ are morphisms.

LEMMA 1872. $f \in \text{Hom}_{\text{cont}(C)}(\prod^{(L)} F, Y)$ **FiXme: What is Y?** is continuous iff all $f \circ \iota^{\text{cont}(C)}$ are continuous.

THEOREM 1873. $\prod^{(L)}$ together with \oplus is a (partial) coproduct in the category $\text{cont}(C)$.

4. Applying this to the theory of funcoids and reloids

4.1. Funcoids.

DEFINITION 1874. **Fcd** $\stackrel{\text{def}}{=} \text{cont FCD}$.

Let F be a family of endofuncoids.

The cartesian product $\prod^{(Q)} X \stackrel{\text{def}}{=} \prod X$.

I define $\pi_i = \pi_i^X \in \text{FCD}(\prod X, X_i)$ as the principal funcoid corresponding to the i -th projection. (Here π is entirely defined.)

The disjoint union $\prod^{(Q)} X \stackrel{\text{def}}{=} \prod X$.

I define $\iota_i = \iota_i^X \in \text{FCD}(X_i, \prod X)$ as the principal funcoid corresponding to the i -th canonical injection. (Here ι is entirely defined.)

Let \otimes and \oplus be defined in the same way as in category **Set**.

OBVIOUS 1875. $\pi_i \circ \otimes f = f_i$; $\otimes_{i \in n} (\pi_i \circ f) = f$.

OBVIOUS 1876. $(\oplus f) \circ \iota_i = f_i$; $\oplus_{i \in n} (f \circ \iota_i) = f$.

It is easy to show that π_i is entirely defined monovalued, and ι_i is metacomplete and co-metacomplete.

Thus we are under conditions for both canonical products and canonical co-products and thus both $\prod^{(L)} F$ and $\prod^{(L)} F$ are defined.

4.2. Reloids.

DEFINITION 1877. $\mathbf{Rld} \stackrel{\text{def}}{=} \text{cont RLD}$.

Let F be a family of endoreloids.

The cartesian product $\prod^{(Q)} X \stackrel{\text{def}}{=} \prod X$.

I define $\pi_i = \pi_i^X \in \text{RLD}(\prod X, X_i)$ as the principal reloid corresponding to the i -th projection. (Here π is entirely defined.)

The disjoint union $\coprod^{(Q)} X \stackrel{\text{def}}{=} \coprod X$.

I define $\iota_i = \iota_i^X \in \text{RLD}(X_i, \coprod X)$ as the principal reloid corresponding to the i -th canonical injection. (Here ι is entirely defined.)

Let \otimes and \oplus are defined in the same way as in category \mathbf{Set} .

OBVIOUS 1878. $\pi_i \circ \otimes f = f_i$; $\otimes_{i \in n} (\pi_i \circ f) = f$.

OBVIOUS 1879. $(\oplus f) \circ \iota_i = f_i$; $\oplus_{i \in n} (f \circ \iota_i) = f$.

It is easy to show that π_i is entirely defined monovalued, and ι_i is metacomplete and co-metacomplete.

Thus we are under conditions for both canonical products and canonical co-products and thus both $\prod^{(L)} F$ and $\coprod^{(L)} F$ are defined.

It is trivial that for uniform spaces infimum product of reloids coincides with product uniformilty.

5. Initial and terminal objects

Initial object of \mathbf{Fcd} is the endofunctor $\uparrow^{\text{FCD}(\emptyset, \emptyset)} \emptyset$. It is initial because it has precisely one morphism o (the empty set considered as a function) to any object Y . o is a morphism because $o \circ \uparrow^{\text{FCD}(\emptyset, \emptyset)} \emptyset \sqsubseteq Y \circ o$.

PROPOSITION 1880. Terminal objects of \mathbf{Fcd} are exactly $\uparrow^{\mathcal{F}} \{*\} \times^{\text{FCD}} \uparrow^{\mathcal{F}} \{*\} = \uparrow^{\text{FCD}} \{(*, *)\}$ where $*$ is an arbitrary point.

PROOF. In order for a function $f : X \rightarrow \uparrow^{\text{FCD}} \{(*, *)\}$ be a morphism, it is required exactly $f \circ X \sqsubseteq \uparrow^{\text{FCD}} \{(*, *)\} \circ f$

$f \circ X \sqsubseteq (f^{-1} \circ \uparrow^{\text{FCD}} \{(*, *)\})^{-1}$; $f \circ X \sqsubseteq (\{*\} \times^{\text{FCD}} \langle f^{-1} \rangle \{*\})^{-1}$; $f \circ X \sqsubseteq \langle f^{-1} \rangle \{*\} \times^{\text{FCD}} \{*\}$ what true exactly when f is a constant function with the value $*$. \square

If $n = \emptyset$ then $Z = \{\emptyset\}$; $\prod^{(L)} \emptyset = \max \text{FCD}(Z, Z) = \uparrow^{\mathcal{F}} \{\emptyset\} \times^{\text{FCD}} \uparrow^{\mathcal{F}} \{\emptyset\} = \uparrow^{\text{FCD}} \{(\emptyset, \emptyset)\}$.

FiXme: Initial and terminal objects of \mathbf{Rld} .

6. Canonical product and subatomic product

FiXme: Confusion between filters on products and multireloids.

PROPOSITION 1881. $\text{Pr}_i^{\text{RLD}} |_{\mathfrak{F}(Z)} = \langle \pi_i \rangle$ for every index i of a cartesian product Z .

PROOF. If $\mathcal{X} \in \mathfrak{F}(Z)$ then $(\text{Pr}_i^{\text{RLD}} |_{\mathfrak{F}(Z)}) \mathcal{X} = \text{Pr}_i^{\text{RLD}} \mathcal{X} = \prod^{\mathcal{F}} \langle \text{Pr}_i \rangle^* \mathcal{X} = \prod \langle \pi_i \rangle \text{up } \mathcal{X} = \langle \pi_i \rangle \mathcal{X}$. \square

PROPOSITION 1882. $\prod^{(A)} F = \prod_{i \in n} \left(\left(\pi_i^{\text{FCD}(\prod_{i \in n} \text{Dst } F)} \right)^{-1} \circ F_i \circ \pi_i^{\text{FCD}(\prod_{i \in n} \text{Src } F)} \right)$.

PROOF. $a \left[\prod^{(A)} F \right] b \Leftrightarrow \forall i \in \text{dom } F : \text{Pr}_i^{\text{RLD}} a [F_i] \text{Pr}_i^{\text{RLD}} b \Leftrightarrow$
 $\forall i \in \text{dom } F : \left\langle \left(\pi_i^{\text{FCD}(\prod_{i \in n} \text{Dst } F)} \right)^{-1} \right\rangle [F_i] \left\langle \pi_i^{\text{FCD}(\prod_{i \in n} \text{Src } F)} \right\rangle \Leftrightarrow$
 $\forall i \in \text{dom } F : a \left[\left(\pi_i^{\text{FCD}(\prod_{i \in n} \text{Dst } F)} \right)^{-1} \circ F_i \circ \pi_i^{\text{FCD}(\prod_{i \in n} \text{Src } F)} \right] b \Leftrightarrow$
 $a \left[\prod_{i \in n} \left(\left(\pi_i^{\text{FCD}(\prod_{i \in n} \text{Dst } F)} \right)^{-1} \circ F_i \circ \pi_i^{\text{FCD}(\prod_{i \in n} \text{Src } F)} \right) \right] b$ for ultrafilters a and b . \square

COROLLARY 1883. $\prod^{(L)} F = \prod^{(A)} F$ if F is a small indexed family of funcoids.

7. Further plans

Does the formula $\prod_{i \in n}^{(L)} (g_i \circ f_i) = \prod^{(L)} g \circ \prod^{(L)} f$ hold?
Coordinate-wise continuity.

8. Cartesian closedness

We are not only to prove (or maybe disprove) that our categories are cartesian closed, but also to find (if any) explicit formulas for exponential transpose and evaluation.

"Definition" A category is //cartesian closed// iff:

- 1°. It has finite products.
- 2°. For each objects A, B is given an object $\text{MOR}(A, B)$ (//exponentiation//) and a morphism $\varepsilon_{A,B}^{\text{Dig}} : \text{MOR}(A, B) \times A \rightarrow B$.
- 3°. For each morphism $f : Z \times A \rightarrow B$ there is given a morphism (//exponential transpose//) $\sim f : Z \rightarrow \text{MOR}(A, B)$.
- 4°. $\varepsilon_{B,C} \circ (\sim f \times 1_A) = f$ for $f : A \rightarrow B \times C$.
- 5°. $\sim (\varepsilon_{B,C} \circ (g \times 1_A)) = g$ for $g : A \rightarrow \text{MOR}(B, C)$.

We will also denote $f \mapsto (-f)$ the reverse of the bijection $f \mapsto (\sim f)$.

Our purpose is to prove (or disprove) that categories **Dig**, **Fcd**, and **Rld** are cartesian closed. Note that they have finite (and even infinite) products is already proved.

Alternative way to prove: you can prove that the functor $- \times B$ is left adjoint to the exponentiation $-^B$ where the counit is given by the evaluation map.

8.1. Definitions. Categories **Dig**, **Fcd**, and **Rld** are respectively categories of:

- 1°. discretely continuous maps between digraphs;
- 2°. (proximally) continuous maps between endofuncoids;
- 3°. (uniformly) continuous maps between endoreloids.

"Definition" //Digraph// is an endomorphism of the category **Rel**.

For a digraph A we denote $\text{Ob } A$ the set of vertexes or A and $\text{GR } A$ the set of edges or A .

"Definition" Category **Dig** of digraphs is the category whose objects are digraphs and morphisms are discretely continuous maps between digraphs. That is morphisms from a digraph μ to a digraph ν are functions (or more precisely morphisms of **Set**) f such that $f \circ \mu \sqsubseteq \nu \circ f$ (or equivalently $\mu \sqsubseteq f^{-1} \circ \nu \circ f$ or equivalently $f \circ \mu \circ f^{-1} \sqsubseteq \nu$).

"Remark" Category of digraphs is sometimes defined in an other (non equivalent) way, allowing multiple edges between two given vertices.

8.2. Conjectures.

CONJECTURE 1884. The categories **Fcd** and **Rld** are cartesian closed (actually two conjectures).

<http://mathoverflow.net/questions/141615/how-to-prove-that-there-are-no-exponential-object-in-a-categ> suggests to investigate colimits to prove that there are no exponential object.

Our purpose is to prove (or disprove) that categories **Dig**, **Fcd**, and **Rld** are cartesian closed. Note that they have finite (and even infinite) products is already proved.

Alternative way to prove: you can prove that the functor $- \times B$ is left adjoint to the exponentiation $-^B$ where the counit is given by the evaluation map.

See <http://www.springer.com/us/book/9780387977102> for another way to prove Cartesian closedness.

8.3. Category Dig is cartesian closed. Category of digraphs is the simplest of our three categories and it is easy to demonstrate that it is cartesian closed. I demonstrate cartesian closedness of **Dig** mainly with the purpose to show a pattern similarly to which we may probably demonstrate our two other categories are cartesian closed.

Let G and H be graphs:

- $\text{Ob MOR}(G, H) = (\text{Ob } H)^{\text{Ob } G}$;
- $(f, g) \in \text{GR MOR}(G, H) \Leftrightarrow \forall (v, w) \in \text{GR } G : (f(v), g(w)) \in \text{GR } H$ for every $f, g \in \text{Ob MOR}(G, H) = (\text{Ob } H)^{\text{Ob } G}$;

$$\text{GR } 1_{\text{MOR}(B, C)} = \text{id}_{\text{Ob MOR}(B, C)} = \text{id}_{(\text{Ob } H)^{\text{Ob } G}}$$

Equivalently

$$(f, g) \in \text{GR MOR}(G, H) \Leftrightarrow \forall (v, w) \in \text{GR } G : g \circ \{(v, w)\} \circ f^{-1} \subseteq \text{GR } H$$

$$(f, g) \in \text{GR MOR}(G, H) \Leftrightarrow g \circ (\text{GR } G) \circ f^{-1} \subseteq \text{GR } H$$

$$(f, g) \in \text{GR MOR}(G, H) \Leftrightarrow \langle f \times^{(C)} g \rangle \text{GR } G \subseteq \text{GR } H$$

The transposition (the isomorphism) is uncurrying.

$$\sim f = \lambda a \in Z \lambda y \in A : f(a, y) \text{ that is } (\sim f)(a)(y) = f(a, y).$$

$$(-f)(a, y) = f(a)(y)$$

$$\text{If } f : A \times B \rightarrow C \text{ then } \sim f : A \rightarrow \text{MOR}(B, C)$$

"Proposition" Transposition and its inverse are morphisms of **Dig**.

"Proof" It follows from the equivalence $\sim f : A \rightarrow \text{MOR}(B, C) \Leftrightarrow \forall x, y :$

$$(x Ay \Rightarrow (\sim f)x(\text{MOR}(B, C))(\sim f)y) \Leftrightarrow$$

$$\forall x, y : (x Ay \Rightarrow \forall (v, w) \in B : ((\sim f)xv, (\sim f)yw) \in C) \Leftrightarrow$$

$$\forall x, y, v, w : (x Ay \wedge v B w \Rightarrow ((\sim f)xv, (\sim f)yw) \in C) \Leftrightarrow$$

$$\forall x, y, v, w : ((x, v)(A \times B)(y, w) \Rightarrow (f(x, v), f(y, w)) \in C) \Leftrightarrow f : A \times B \rightarrow C.$$

Evaluation $\varepsilon : \text{MOR}(G, H) \times G \rightarrow H$ is defined by the formula:

$$\text{Then evaluation is } \varepsilon_{B, C} = -(\text{1}_{\text{MOR}(B, C)}).$$

$$\text{So } \varepsilon_{B, C}(p, q) = (-(\text{1}_{\text{MOR}(B, C)}))(p, q) = (\text{1}_{\text{MOR}(B, C)})(p)(q) = p(q).$$

"Proposition" Evaluation is a morphism of **Dig**.

"Proof" Because $\varepsilon_{B, C}(p, q) = -(\text{1}_{\text{MOR}(B, C)})$.

It remains to prove: $* \varepsilon_{B, C} \circ (\sim f \times 1_A) = f$ for $f : A \rightarrow B \times C$; $* \sim (\varepsilon_{B, C} \circ (g \times 1_A)) = g$ for $g : A \rightarrow \text{MOR}(B, C)$.

"Proof" $\varepsilon_{B, C}(\sim f \times 1_A)(a, p) = \varepsilon_{B, C}((\sim f)a, p) = (\sim f)ap = f(a, p)$. So $\varepsilon_{B, C} \circ (\sim f \times 1_A) = f$.

$\sim (\varepsilon_{B, C} \circ (g \times 1_A))(p)(q) = (\varepsilon_{B, C} \circ (g \times 1_A))(p, q) = \varepsilon_{B, C}(g \times 1_A)(p, q) = \varepsilon_{B, C}(gp, q) = g(p)(q)$. So $\sim (\varepsilon_{B, C} \circ (g \times 1_A)) = g$.

8.4. By analogy with the proof that Dig is cartesian closed. The most obvious way for proof attempt that **Fcd** is cartesian closed is an analogy with the proof that **Dig** is cartesian closed.

Consider the long formula above. The proof would arise if we replace x and y in this formula with filters and operations and relations on set element with operations and relations on filters.

This proof could be simplified in either of two ways:

- replace x and y with ultrafilters, see [[Proof for Fcd using ultrafilters]];
- replace x and y with sets (principal filter), see [[Proof for Fcd using sets]].

This is not quite easy however, because we need to calculate uncurrying for a entirely defined monovalued principal funcoind (what is essentially the same as a function of a **Set**-morphisms) taking either ultrafilters or principal filters as arguments. Such (generalized) uncurrying is not quite easy.

To sum what we need to prove:

- Transposition is a morphism.
- Evaluation is a morphism.
- $\varepsilon_{B,C} \circ (\sim f \times 1_A) = f$ for $f : A \rightarrow B \times C$.
- $\sim (\varepsilon_{B,C} \circ (g \times 1_A)) = g$ for $g : A \rightarrow \text{MOR}(B, C)$.

8.5. Attempt to describe exponentials in Fcd.

- Exponential object $\text{HOM}(A, B)$ is the following endofuncoind:
 - Object $\text{Ob } \text{HOM}(A, B) = (\text{Ob } B)^{\text{Ob } A}$;
 - Graph is $\text{GR } \text{HOM}(A, B) = \uparrow^{\text{FCD}} \left\{ \frac{(f,g)}{f,g \in \text{Hom}_{\text{Set}}(\text{Ob } A, \text{Ob } B) \wedge \uparrow^{\text{FCD}} g \circ A \circ \uparrow^{\text{FCD}} f^{-1} \sqsubseteq B} \right\}$.
- Transposition is uncurrying.
- Evaluation is $\varepsilon_{A,B} x = \langle \text{Pr}_0^{(A)} x \rangle \text{Pr}_1^{(A)} x$.

We need to prove that the above defined are really an exponential and an evaluation.

Possible ways to prove that **Fcd** is cartesian closed follow:

8.6. Proof for Fcd using sets. Currying for sets is $\langle f \rangle (X \times Y) = \bigcup \langle \langle \sim f \rangle X \rangle Y$ (as it's easy to prove). This simple formula gives hope, but...

It does not work with sets because an analogy for sets of the last equality of the above mentioned long formula would be:

$$\forall X, Y, V, W \in \mathcal{P} \text{Ob } A : (X \times V [A \times B]^* Y \times W \Rightarrow \langle f \rangle (X \times V) [C]^* \langle f \rangle (Y \times W)) \Rightarrow$$

$$f : A \times B \rightarrow C$$

but this implication seems false.

The most obvious way for proof attempt that **Fcd** is cartesian closed is an analogy with the proof that **Dig** is cartesian closed.

Use the exponential object, transposition, and evaluation as defined in [[this page|Is category Fcd cartesian closed?]]

8.7. Reducing to the fact that Dig is cartesian closed. It is probably a simpler way to prove that **Fcd** is cartesian closed by embedding it into **Dig** (which is [[already known to be cartesian closed|Category Dig is cartesian closed]]).

Fcd can be embedded into **Dig** by the formulas:

- $A \mapsto \langle A \rangle$;
- $f \mapsto \langle f \rangle$.

That this really maps a morphism of **Fcd** into a morphism of **Dig** follows from the fact that $\langle g \circ f \rangle = \langle g \rangle \circ \langle f \rangle$.

Obviously this embedding (denote it T) is an injective (both on objects and morphisms) functor.

We will define:

- $\varepsilon_{A,B}^{\text{Fcd}} = T^{-1} \varepsilon_{TA, TB}^{\text{Dig}}$;
- $\sim^{\text{Fcd}} f = T^{-1} \sim^{\text{Dig}} T f$.

Due to functoriality and injectivity of T it is enough to prove that above defined $\varepsilon_{A,B}^{\mathbf{Fcd}}$ and $\sim^{\mathbf{Fcd}} f$ exist and are morphisms of \mathbf{Fcd} .

$\varepsilon_{TA,TB}^{\mathbf{Dig}} \neq T\varepsilon_{A,B}^{\mathbf{Fcd}}$ because $\varepsilon_{TA,TB}^{\mathbf{Dig}}$ accepts ordered pairs as the argument and $T\varepsilon_{A,B}^{\mathbf{Fcd}}$ accepts sets as the argument. So this is a dead end. Can the proof idea be salvaged?

9. Is category Rld cartesian closed?

We may attempt to prove that \mathbf{Rld} is cartesian closed by embedding it into supposedly cartesian closed category \mathbf{Fcd} by the function ρ :

$$\langle \rho f \rangle x = f \circ x \quad \text{and} \quad \langle \rho f^{-1} \rangle y = f^{-1} \circ y.$$

TODO: More to write on this topic.

Equalizers and co-Equalizers in Certain Categories

It is a rough draft. Errors are possible.

FiXme: Change notation $\amalg \rightarrow \amalg^{(L)}$.

1. Categories with embeddings

NOTE 1885. This section is not used below, it is just to feed your intuition.

The following generalizes the well known concept of embedding function $A \hookrightarrow B$ from a set A to a set B where $A \subseteq B$.

I will set that the unique morphism from an object A to an object B of a thin category is equal to the pair (A, B) .

DEFINITION 1886. A *category with embeddings of objects* is a dagger category with a preorder of the set of objects together with a functor \hookrightarrow (we will denote applying this functor to the object (A, B) as $A \hookrightarrow B$.) such that:

- \hookrightarrow is an identity on objects.
- Every $A \hookrightarrow B$ is a monomorphism.
- $(A \hookrightarrow B)^\dagger \circ (A \hookrightarrow B) = 1_A$.

OBVIOUS 1887. $A \hookrightarrow B$ is defined when (A, B) is a morphism of the preorder that is when $A \subseteq B$.

OBVIOUS 1888. $A \hookrightarrow B : A \rightarrow B$ when $A \subseteq B$.

PROPOSITION 1889. $A \hookrightarrow A = 1_A$.

PROOF. Because (A, A) is an identity morphism and \hookrightarrow preserves identities. \square

PROPOSITION 1890. $(B \hookrightarrow C) \circ (A \hookrightarrow B) = A \hookrightarrow C$ whenever $A \subseteq B \subseteq C$.

PROOF. $(B \hookrightarrow C) \circ (A \hookrightarrow B) = \hookrightarrow (B, C) \circ \hookrightarrow (A, B) = \hookrightarrow ((B, C) \circ (A, B)) = \hookrightarrow (A, C) = A \hookrightarrow C$. \square

2. Categories under Rel

DEFINITION 1891. The **Rel**-morphism $\mathcal{E}^{A,B}$ (*restriction-embedding*) is defined by the formula: $\mathcal{E}^{A,B} = (A, B, \text{id}_{A \cap B})$.

When A is clear from context, I will denote it just as \mathcal{E}^B .

OBVIOUS 1892. If $A \subseteq B$ then $\mathcal{E}^{A,B}$ is an embedding $A \hookrightarrow B = (A, B, \text{id}_A)$.

OBVIOUS 1893. If $A \supseteq B$ then $\mathcal{E}^{A,B} = (A, B, \text{id}_B)$.

OBVIOUS 1894. $\mathcal{E}^{A,A} = 1_A^{\mathbf{Rel}}$.

OBVIOUS 1895. $(\mathcal{E}^{A,B})^{-1} = \mathcal{E}^{B,A}$.

DEFINITION 1896. *Dagger functor* between two dagger categories is a functor between these categories, which commutes with the daggers. FiXme: Clearer wording.

DEFINITION 1897. *Category under **Rel*** is a pair (C, \uparrow) where C is a category whose objects are small sets and \uparrow is an identity-on-objects functor $\mathbf{Rel} \rightarrow C$. I call \uparrow *up-arrow functor*.

DEFINITION 1898. *Dagger category under **Rel*** is a pair (C, \uparrow) where C is a dagger category whose objects are small sets and \uparrow is a dagger identity-on-objects functor $\mathbf{Rel} \rightarrow C$.

DEFINITION 1899. $\mathcal{E}_C^{A,B} = \uparrow \mathcal{E}^{A,B}$. In other words, $\mathcal{E}_C = \uparrow \circ \mathcal{E}$. When A is clear from context, I will denote it just as \mathcal{E}_C^B .

PROPOSITION 1900. $\mathcal{E}_C^{A,A} = 1_C^A$.

PROOF. $\mathcal{E}_C^{A,A} = \uparrow \mathcal{E}^{A,A} = \uparrow 1_{\mathbf{Rel}} = 1_C^A$. \square

PROPOSITION 1901. If $f : X \rightarrow Y$ is a **Rel**-morphism and $\text{im } f = A \subseteq Y$ then

$$\mathcal{E}^{A,Y} \circ \mathcal{E}^{Y,A} \circ f = f.$$

PROOF. $\mathcal{E}^{A,Y} \circ \mathcal{E}^{Y,A} \circ f = \text{id}_A \circ f = f$. \square

COROLLARY 1902. If $f : X \rightarrow Y$ is a morphism of a category under **Rel** and $\text{im } f = A \subseteq Y$, then

$$\mathcal{E}_C^{A,Y} \circ \mathcal{E}_C^{Y,A} \circ \uparrow f = \uparrow f.$$

PROPOSITION 1903.

1°. If $A \subseteq B$ then $\mathcal{E}_C^{A,B}$ is a monomorphism.

2°. If $A \supseteq B$ then $\mathcal{E}_C^{A,B}$ is an epimorphism.

PROOF. We'll prove only the first as the second is dual.

Let $\mathcal{E}_C^{A,B} \circ f = \mathcal{E}^{A,B} \circ g$. Then $\mathcal{E}^{B,A} \circ \mathcal{E}_C^{A,B} \circ f = \mathcal{E}^{B,A} \circ \mathcal{E}_C^{A,B} \circ g$; $1^A \circ f = 1^A \circ g$; $f = g$. \square

PROPOSITION 1904. $\mathcal{E}^{B,C} \circ \mathcal{E}^{A,B} = \mathcal{E}^{A,C}$ iff $B \supseteq A \cap C$ (for every sets A, B, C).

PROOF. $\mathcal{E}^{B,C} \circ \mathcal{E}^{A,B} = \mathcal{E}^{A,C}$ is equivalent to:

$$(B, C, \text{id}_{B \cap C}) \circ (A, B, \text{id}_{A \cap B}) = (A, C, \text{id}_{A \cap C});$$

$$(A, C, \text{id}_{A \cap B \cap C}) = (A, C, \text{id}_{A \cap C});$$

$$A \cap B \cap C = A \cap C;$$

$$B \supseteq A \cap C. \quad \square$$

COROLLARY 1905. $\mathcal{E}^{B,C} \circ \mathcal{E}^{A,B} = \mathcal{E}^{A,C}$ if $B \supseteq A \cap C$ (for every sets A, B, C).

DEFINITION 1906. *Partially ordered dagger category under **Rel*** is a category which is both a partially ordered dagger category and a category under **Rel** such that $\uparrow \circ f^{-1} = (\uparrow \circ f)^\dagger$ and $A \subseteq B \Rightarrow \uparrow A \sqsubseteq \uparrow B$.

PROPOSITION 1907. $(\mathcal{E}_C^{A,B})^\dagger = \mathcal{E}_C^{B,A}$ for a dagger category under **Rel**.

PROOF. $(\mathcal{E}_C^{A,B})^\dagger = (\uparrow \mathcal{E}^{A,B})^\dagger = \uparrow (\mathcal{E}^{A,B})^{-1} = \uparrow \mathcal{E}^{B,A} = \mathcal{E}_C^{B,A}$. \square

PROPOSITION 1908. For a partially ordered dagger category \mathcal{C} under **Rel** we have $\mathcal{E}_C^{A,B}$ is:

1°. monovalued;

2°. injective;

3°. entirely defined if $A \subseteq B$;

4°. surjective if $B \subseteq A$.

PROOF.

1°. $\mathcal{E}^{A,B} \circ \mathcal{E}^{B,A} \sqsubseteq 1_B^{\mathbf{Rel}}$; $\mathcal{E}^{A,B} \circ (\mathcal{E}^{A,B})^{-1} \sqsubseteq 1_B^{\mathbf{Rel}}$; $\mathcal{E}_C^{A,B} \circ (\mathcal{E}_C^{A,B})^\dagger \sqsubseteq 1_B^{\mathcal{C}}$.

- 2°. $\mathcal{E}^{B,A} \circ \mathcal{E}^{A,B} \sqsubseteq 1_A^{\mathbf{Rel}}$; $(\mathcal{E}^{A,B})^{-1} \circ \mathcal{E}^{A,B} \sqsubseteq 1_A^{\mathbf{Rel}}$; $(\mathcal{E}_C^{A,B})^\dagger \circ \mathcal{E}^{A,B} \sqsubseteq 1_A^{\mathcal{C}}$.
3°. $\mathcal{E}^{B,A} \circ \mathcal{E}^{A,B} \sqsupseteq 1_A^{\mathbf{Rel}}$; $(\mathcal{E}^{A,B})^{-1} \circ \mathcal{E}^{A,B} \sqsupseteq 1_A^{\mathbf{Rel}}$; $(\mathcal{E}_C^{A,B})^\dagger \circ \mathcal{E}_C^{A,B} \sqsupseteq 1_A^{\mathcal{C}}$.
4°. $\mathcal{E}^{A,B} \circ \mathcal{E}^{B,A} \sqsupseteq 1_A^{\mathbf{Rel}}$; $\mathcal{E}^{A,B} \circ (\mathcal{E}^{A,B})^{-1} \sqsupseteq 1_A^{\mathbf{Rel}}$; $\mathcal{E}_C^{A,B} \circ (\mathcal{E}_C^{A,B})^\dagger \sqsupseteq 1_A^{\mathcal{C}}$.

□

3. Rectangular embedding-restriction

DEFINITION 1909. $\iota_{B_0, B_1} f = \mathcal{E}_C^{B_1} \circ f \circ (\mathcal{E}_C^{B_0})^{-1}$ for $f \in \text{Hom}_C(A_0, A_1)$.

For brevity $\iota_B f = \iota_{B, B} f$.

PROPOSITION 1910. $\iota_{\text{Src } f, \text{Dst } f} f = f$.

PROOF. $\iota_{\text{Src } f, \text{Dst } f} f = \mathcal{E}_C^{\text{Dst } f} \circ f \circ \mathcal{E}_C^{\text{Src } f} = 1_C^{\text{Dst } f} \circ f \circ 1_C^{\text{Src } f} = f$. □

PROPOSITION 1911. The function $\iota_{B_0, B_1} |_{f \in \text{Hom}_C(A_0, A_1)}$ is injective, if $A_0 \subseteq B_0 \wedge A_1 \subseteq B_1$.

PROOF. Because $\mathcal{E}_C^{A_1, B_1}$ is a monomorphism and $\mathcal{E}_C^{A_0, B_0}$ is an epimorphism. □

PROPOSITION 1912. $\iota_{C_0, C_1} \iota_{B_0, B_1} f = \iota_{C_0, C_1} f$ for $B_0 \supseteq A_0 \cap C_0$, $B_1 \supseteq A_1 \cap C_1$ and $f : A_0 \rightarrow A_1$.

PROOF. $\iota_{C_0, C_1} \iota_{B_0, B_1} f = \mathcal{E}_C^{B_1, C_1} \circ \mathcal{E}_C^{A_1, B_1} \circ f \circ \mathcal{E}_C^{B_0, A_0} \circ \mathcal{E}_C^{C_0, B_0} = \mathcal{E}_C^{A_1, C_1} \circ f \circ \mathcal{E}_C^{C_0, A_0} = \iota_{C_0, C_1} f$. □

PROPOSITION 1913. Let $f : A_0 \rightarrow A_1$ and $g : A_1 \rightarrow A_2$ and $A_1 \subseteq B_1$. Then $\iota_{B_0, B_2}(g \circ f) = \iota_{B_1, B_1} g \circ \iota_{B_0, B_1} f$.

PROOF. $\iota_{B_0, B_2}(g \circ f) = \mathcal{E}_C^{A_2, B_2} \circ (g \circ f) \circ \mathcal{E}_C^{B_0, A_0} = \mathcal{E}_C^{A_2, B_2} \circ g \circ \text{id}_{A_1} \circ f \circ \mathcal{E}_C^{B_0, A_0} = \mathcal{E}_C^{A_2, B_2} \circ g \circ \mathcal{E}_C^{B_1, A_1} \circ \mathcal{E}_C^{A_1, B_1} \circ f \circ \mathcal{E}_C^{B_0, A_0} = \iota_{B_1, B_1} g \circ \iota_{B_0, B_1} f$. □

4. Examples of partially ordered dagger categories under Rel

4.1. Generalized rebase of filters. In [5] I defined *rebase* $\mathcal{A} \div A$ for a set-theoretic filter \mathcal{A} and a set X such that $\exists X \in \mathcal{A} : X \subseteq A$.

Now define a generalized rebase for every set-theoretic filter \mathcal{A} and every set A :

DEFINITION 1914. $\mathcal{A} \div A = \prod \left\{ \frac{\uparrow^A(X \cap A)}{X \in \mathcal{A}} \right\}$.

PROPOSITION 1915. These two definitions coincide.

PROOF. It is proved in [5] $\left\{ \frac{X \in \mathcal{P}A}{\exists Y \in \mathcal{A} : Y \cap A \subseteq X} \right\}$ is a filter.

If $P \in \left\{ \frac{X \in \mathcal{P}A}{\exists Y \in \mathcal{A} : Y \cap A \subseteq X} \right\}$ then $P \in \mathcal{P}A$ and $Y \cap A \subseteq P$ for some $Y \in \mathcal{A}$. Thus $P \supseteq Y \cap A \in \prod \left\{ \frac{\uparrow^A(Y \cap A)}{Y \in \mathcal{A}} \right\}$.

If $P \in \prod \left\{ \frac{\uparrow^A(X \cap A)}{X \in \mathcal{A}} \right\}$ then by properties of generalized filter bases, there exists $X \in \mathcal{A}$ such that $P \supseteq X \cap A$. Also $P \in \mathcal{P}A$. Thus $P \in \left\{ \frac{X \in \mathcal{P}A}{\exists Y \in \mathcal{A} : Y \cap A \subseteq X} \right\}$.

FixMe: Clear this proof: wording, consistent use of letters. □

PROPOSITION 1916. $(\mathcal{X} \div A) \div B = \mathcal{X} \div B$ if $B \subseteq A$.

PROOF. $(\mathcal{X} \div A) \div B = \prod \left\{ \frac{\uparrow^B(Y \cap B)}{Y \in \prod \left\{ \frac{\uparrow^A(X \cap A)}{X \in \mathcal{X}} \right\}} \right\} = \prod \left\{ \frac{\uparrow^B(X \cap A)}{X \in \mathcal{X}} \right\} \cap \uparrow^B B = \prod \left\{ \frac{\uparrow^B(X \cap A \cap B)}{X \in \mathcal{X}} \right\} = \mathcal{X} \div (A \cap B) = \mathcal{X} \div B$. □

4.2. Category Rel. Category **Rel** with the identity up-arrow functor to itself and “reverse relation” as the dagger is an obvious example of a partially ordered dagger category under **Rel**.

PROPOSITION 1917. $\iota_{A,B}f = (A, B, \text{GR } f \cap (A \times B))$.

PROOF. $\iota_{A,B}f = \mathcal{E}^B \circ f \circ (\mathcal{E}^A)^{-1} = (A, B, \text{GR } f \cap (A \times B))$. \square

4.3. Category FCD. Category FCD with the up-arrow functor \uparrow^{FCD} and “reverse funcoïd” as the dagger is a partially ordered dagger category under **Rel**.

PROPOSITION 1918. $\mathcal{E}_{\text{FCD}}^{A,B} = (A, B, \lambda \mathcal{X} \in \mathfrak{F}(A) : \mathcal{X} \div B, \lambda \mathcal{Y} \in \mathfrak{F}(B) : \mathcal{Y} \div A)$ for objects $A \subseteq B$ of FCD.

PROOF. $\langle \mathcal{E}_{\text{FCD}}^{A,B} \rangle \mathcal{X} = \prod \left\{ \frac{\langle \mathcal{E}_{\text{FCD}}^{A,B} \rangle^* X}{X \in \mathcal{X}} \right\} = \prod \left\{ \frac{\uparrow^B \langle \mathcal{E}^{A,B} \rangle X}{X \in \mathcal{X}} \right\} = \prod \left\{ \frac{\uparrow^B (X \cap A \cap B)}{X \in \mathcal{X}} \right\} = \prod \left\{ \frac{\uparrow^B (X \cap B)}{X \in \mathcal{X}} \right\} = \mathcal{X} \div B$.

Rest follows from symmetry. \square

PROPOSITION 1919.

1 $^\circ$. $\langle \mathcal{E}_{\text{FCD}}^{A,B} \rangle^* X = \uparrow^B X$ for every $X \in \mathcal{P}A$ if $A \subseteq B$.

2 $^\circ$. $\langle \mathcal{E}_{\text{FCD}}^{B,A} \rangle^* Y = \uparrow^A (Y \cap A)$ for every $Y \in \mathcal{P}B$ if $A \subseteq B$.

PROOF. By definition of principal funcoïd. \square

4.4. Category RLD. Category RLD with the up-arrow functor \uparrow^{RLD} and “reverse reloid” as the dagger is a partially ordered dagger category under **Rel**.

OBVIOUS 1920. $\mathcal{E}_{\text{RLD}}^{A,B} = \uparrow^{\text{RLD}(A,B)} \text{id}_{A \cap B}$.

DEFINITION 1921. $f \div (A \times B) = (A, B, (\text{GR } f) \div (A \times B))$ for every reloid f .

PROPOSITION 1922. $\iota_{A,B}f = f \div (A \times B)$.

PROOF. $\iota_{A,B}f = \mathcal{E}_{\text{RLD}}^B \circ f \circ (\mathcal{E}_{\text{RLD}}^A)^{-1} = \prod \left\{ \frac{\uparrow^{\text{RLD}}(\mathcal{E}^B \circ F \circ (\mathcal{E}^A)^{-1})}{F \in \text{GR } f} \right\} = \prod \left\{ \frac{\uparrow^{\text{RLD}}(F \cap (A \times B))}{F \in \text{GR } f} \right\} = f \div (A \times B)$.

Fixme: Filters on cartesian products vs reloids. \square

4.5. Some isomorphisms.

PROPOSITION 1923. $\left\{ \frac{(A \div A, A \cap A)}{A \in \mathfrak{F}(U)} \right\}$ is a function and moreover is an order isomorphism for a set $A \subseteq U$.

PROOF. $\mathcal{A} \div A$ and $\mathcal{A} \cap A$ are determined by each other by the following formulas:

$$\mathcal{A} \div A = (\mathcal{A} \cap A) \div A \quad \text{and} \quad \mathcal{A} \cap A = (\mathcal{A} \div A) \div \text{Base}(\mathcal{A}).$$

Prove the formulas: $(\mathcal{A} \cap A) \div A = \prod \left\{ \frac{\uparrow^A (X \cap A)}{X \in \mathcal{A} \cap A} \right\} = \prod \left\{ \frac{\uparrow^A (X \cap A)}{X \in \mathcal{A}} \right\} = \mathcal{A} \div A$.

$$(\mathcal{A} \div A) \div \text{Base}(\mathcal{A}) = \prod \left\{ \frac{\uparrow^A (X \cap A)}{X \in \mathcal{A}} \right\} \div \text{Base}(\mathcal{A}) = \prod \left\{ \frac{\uparrow^{\text{Base}(\mathcal{A})} (Y \cap \text{Base}(\mathcal{A}))}{Y \in \prod \left\{ \frac{\uparrow^A (X \cap A)}{X \in \mathcal{A}} \right\}} \right\} =$$

(by properties of filter bases) $= \prod \left\{ \frac{\uparrow^{\text{Base}(\mathcal{A})} (X \cap A \cap \text{Base}(\mathcal{A}))}{X \in \text{Base}(\mathcal{A})} \right\} = \prod \left\{ \frac{\uparrow^{\text{Base}(\mathcal{A})} (X \cap A)}{X \in \text{Base}(\mathcal{A})} \right\} = \mathcal{A} \cap A$.

That this defines a bijection, follows from $\mathcal{A} \div A \sim \mathcal{A} \cap A$ what easily follows from the above formulas. \square

PROPOSITION 1924. $\left\{ \frac{(\iota_{X,Y} f, \text{id}_Y^{\text{Rel}} \circ f \circ \text{id}_X^{\text{Rel}})}{f \in \text{Rel}(A,B)} \right\}$ is a function and moreover is an (order and semigroup) isomorphism, for sets $X \subseteq \text{Src } f$, $Y \subseteq \text{Dst } f$.

PROOF. $\iota_{X,Y}f = (X, Y, \text{GR } f \cap (X \times Y))$; $\text{id}_Y^{\mathbf{Rel}} \circ f \circ \text{id}_X^{\mathbf{Rel}} = (\text{Src } f, \text{Dst } f, \text{GR } f \cap (X \times Y))$. The isomorphism (both order and semigroup) is evident. \square

PROPOSITION 1925. $\left\{ \frac{(\iota_{X,Y}f, \text{id}_Y^{\text{FCD}} \circ f \circ \text{id}_X^{\text{FCD}})}{f \in \text{FCD}(A,B)} \right\}$ is a function and moreover is an (order and semigroup) isomorphism, for sets $X \subseteq \text{Src } f$, $Y \subseteq \text{Dst } f$.

PROOF. From symmetry it follows that it's enough to prove that $\left\{ \frac{(\mathcal{E}^Y \circ f, \text{id}_Y^{\text{FCD}} \circ f)}{f \in \text{FCD}(A,B)} \right\}$ is a function and moreover is an (order and semigroup) isomorphism, for a set $Y \subseteq \text{Dst } f$.

Really, $\left\{ \frac{((\mathcal{E}^Y)_x, (\text{id}_Y^{\text{FCD}})_x)}{x \in \text{Dst } f} \right\} = \left\{ \frac{(x \div Y, x \sqcap Y)}{x \in \text{Dst } f} \right\}$ is an order isomorphism by proved above. This implies that $\left\{ \frac{(\mathcal{E}^Y \circ f, \text{id}_Y^{\text{FCD}} \circ f)}{f \in \text{FCD}(A,B)} \right\}$ is an isomorphism (both order and semigroup). \square

PROPOSITION 1926. $\left\{ \frac{(\iota_{X,Y}f, \text{id}_Y^{\text{RLD}} \circ f \circ \text{id}_X^{\text{RLD}})}{f \in \text{RLD}(A,B)} \right\}$ is a function and moreover is an (order and semigroup) isomorphism, for sets $X \subseteq \text{Src } f$, $Y \subseteq \text{Dst } f$.

PROOF. $\iota_{X,Y}f = (X, Y, (\text{up } f) \div (X \times Y))$; $\text{id}_Y^{\text{RLD}} \circ f \circ \text{id}_X^{\text{RLD}} = (\text{Src } f, \text{Dst } f, (\text{up } f) \sqcap (X \times Y))$. They are order isomorphic by proved above.

$\iota_{Y,Z}g \circ \iota_{X,Y}f = \mathcal{E}^Z \circ g \circ (\mathcal{E}^Y)^{-1} \circ \mathcal{E}^Y \circ f \circ (\mathcal{E}^X)^{-1} = \mathcal{E}^Z \circ g \circ \text{id}_Y^{\text{RLD}} \circ \text{id}_Y^{\text{RLD}} \circ f \circ (\mathcal{E}^X)^{-1}$ because $(\mathcal{E}^Y)^{-1} \circ \mathcal{E}^Y = \text{id}_Y^{\mathbf{Rel}} = \text{id}_Y^{\mathbf{Rel}} \circ \text{id}_Y^{\mathbf{Rel}}$. Thus by proved above

$$\left\{ \frac{(\iota_{Y,Z}g \circ \iota_{X,Y}f, \text{id}_Z^{\text{RLD}} \circ g \circ \text{id}_Y^{\text{RLD}} \circ \text{id}_Y^{\text{RLD}} \circ f \circ \text{id}_X^{\text{RLD}})}{f \in \text{RLD}(A,B)} \right\}$$

is a bijection. \square

5. Equalizers

Categories $\text{cont}(\mathcal{C})$ are defined above.

I will denote W the forgetful functor from $\text{cont}(\mathcal{C})$ to \mathcal{C} .

In the definition of the category $\text{cont}(\mathcal{C})$ take values of \uparrow as principal morphisms.

FiXme: Wording.

LEMMA 1927. Let $f : X \rightarrow Y$ be a morphism of the category $\text{cont}(\mathcal{C})$ where \mathcal{C} is a concrete category (so $Wf = \uparrow \varphi$ for a \mathbf{Rel} -morphism φ because f is principal) and $\text{im } \varphi = A \subseteq \text{Ob } Y$. Factor it $\varphi = \mathcal{E}^{\text{Ob } Y} \circ u$ where $u : \text{Ob } X \rightarrow A$ using properties of \mathbf{Set} . Then u is a morphism of $\text{cont}(\mathcal{C})$ (that is a continuous function $X \rightarrow \iota_A Y$).

PROOF. $(\mathcal{E}^{\text{Ob } Y})^{-1} \circ \varphi = (\mathcal{E}^{\text{Ob } Y})^{-1} \circ \mathcal{E}^{\text{Ob } Y} \circ u$;

$(\mathcal{E}_C^{\text{Ob } Y})^{-1} \circ \uparrow \varphi = (\mathcal{E}_C^{\text{Ob } Y})^{-1} \circ \mathcal{E}_C^{\text{Ob } Y} \circ \uparrow u$;

$(\mathcal{E}_C^{\text{Ob } Y})^{-1} \circ \uparrow \varphi = \uparrow u$;

$X \sqsubseteq (\uparrow u)^{-1} \circ \pi_A Y \circ \uparrow u \Leftrightarrow X \sqsubseteq (\uparrow \varphi)^{-1} \circ \mathcal{E}_C^{\text{Ob } Y} \circ \pi_A Y \circ (\mathcal{E}_C^{\text{Ob } Y})^{-1} \circ \uparrow \varphi \Leftrightarrow X \sqsubseteq (\uparrow \varphi)^{-1} \circ \mathcal{E}_C^{\text{Ob } Y} \circ (\mathcal{E}_C^{\text{Ob } Y})^{-1} \circ Y \circ \mathcal{E}_C^{\text{Ob } Y} \circ (\mathcal{E}_C^{\text{Ob } Y})^{-1} \circ \uparrow \varphi \Leftrightarrow X \sqsubseteq (\uparrow \varphi)^{-1} \circ Y \circ \uparrow \varphi \Leftrightarrow X \sqsubseteq (Wf)^{-1} \circ Y \circ Wf$ what is true by definition of continuity. \square

Equational definition of equalizers:

<http://nforum.mathforge.org/comments.php?DiscussionID=5328/>

THEOREM 1928. The following is an equalizer of parallel morphisms $f, g : A \rightarrow B$ of category $\text{cont}(\mathcal{C})$:

- the object $X = \iota_{\left\{ \frac{x \in \text{Ob } A}{f x = g x} \right\}} A$;
- the morphism $\mathcal{E}^{\text{Ob } X, \text{Ob } A}$ considered as a morphism $X \rightarrow A$.

PROOF. Denote $e = \mathcal{E}^{\text{Ob } X, \text{Ob } A}$.

Let $f \circ z = g \circ z$ for some morphism z .

Let's prove $e \circ u = z$ for some $u : \text{Src } z \rightarrow X$. Really, as a morphism of **Set** it exists and is unique.

Consider z as a generalized element.

$f(z) = g(z)$. So $z \in X$ (that is $\text{Dst } z \in X$). Thus $z = e \circ u$ for some u (by properties of **Set**). The generalized element u is a $\text{cont}(\mathcal{C})$ -morphism because of the lemma above. It is unique by properties of **Set**. \square

We can (over)simplify the above theorem by the obvious below:

OBVIOUS 1929. $\left\{ \frac{x \in \text{Ob } A}{f x = g x} \right\} = \text{dom}(f \cap g)$.

6. Co-equalizers

<http://math.stackexchange.com/questions/539717/how-to-construct-co-equalizers-in-mathbf{top}>

Let \sim be an equivalence relation. Let's denote π its canonical projection.

DEFINITION 1930. $f / \sim = \uparrow \pi \circ f \circ \uparrow \pi^{-1}$ for every morphism f .

OBVIOUS 1931. $\text{Ob}(f / \sim) = (\text{Ob } f) / r$.

OBVIOUS 1932. $f / \sim = \langle \uparrow^{\text{FCD}} \pi \times^{(C)} \uparrow^{\text{FCD}} \pi \rangle f$ for every morphism f .

To define co-equalizers of morphisms f and g let \sim be the smallest equivalence relation such that $f x = g x$.

LEMMA 1933. Let $f : X \rightarrow Y$ be a morphism of the category $\text{cont}(\mathcal{C})$ where \mathcal{C} is a concrete category (so $W f = \uparrow \varphi$ for a **Rel**-morphism φ because f is principal) such that φ respects \sim . Factor it $\varphi = u \circ \pi$ where $u : \text{Ob}(X / \sim) \rightarrow \text{Ob } Y$ using properties of **Set**. Then u is a morphism of $\text{cont}(\mathcal{C})$ (that is a continuous function $X / \sim \rightarrow Y$).

PROOF. $f \circ X \circ f^{-1} \sqsubseteq Y$; $\uparrow u \circ \uparrow \pi \circ X \circ \uparrow \pi^{-1} \circ \uparrow u^{-1} \sqsubseteq Y$; $\uparrow u \in \mathcal{C}(\uparrow \pi \circ X \circ \uparrow \pi^{-1}, Y) = \mathcal{C}(X / \sim, Y)$. \square

THEOREM 1934. The following is a co-equalizer of parallel morphisms $f, g : A \rightarrow B$ of category $\text{cont}(\mathcal{C})$:

- the object $Y = f / \sim$;
- the morphism π considered as a morphism $B \rightarrow Y$.

PROOF. Let $z \circ f = z \circ g$ for some morphism z .

Let's prove $u \circ \pi = z$ for some $u : Y \rightarrow \text{Dst } z$. Really, as a morphism of **Set** it exists and is unique.

$\text{Src } z \in Y$. Thus $z = u \circ \pi$ for some u (by properties of **Set**). The function u is a $\text{cont}(\mathcal{C})$ -morphism because of the lemma above. It is unique by properties of **Set** (π obviously respects equivalence classes). \square

7. Rest

THEOREM 1935. The categories $\text{cont}(\mathcal{C})$ (for example in **Fcd** and **Rld**) are complete. **FixMe: Note that small complete category is a preorder!**

PROOF. They have products and equalizers. \square

THEOREM 1936. The categories $\text{cont}(\mathcal{C})$ (for example in **Fcd** and **Rld**) are co-complete.

PROOF. They have co-products and co-equalizers. \square

DEFINITION 1937. I call morphisms f and g of a category with embeddings *equivalent* ($f \sim g$) when there exist a morphism p such that $\text{Src } p \sqsubseteq \text{Src } f$, $\text{Src } p \sqsubseteq \text{Src } g$, $\text{Dst } p \sqsubseteq \text{Dst } f$, $\text{Dst } p \sqsubseteq \text{Dst } g$ and $\iota_{\text{Src } f, \text{Dst } f} p = f$ and $\iota_{\text{Src } g, \text{Dst } g} p = g$.

PROBLEM 1938. Find under which conditions:

- 1°. Equivalence of morphisms is an equivalence relation.
- 2°. Equivalence of morphisms is a congruence for our category.

Categories of filters

In [1] two categories, whose objects are related with filters on sets, are defined and researched.

Accordingly [1] infinite product is defined just in the first (denoted \mathcal{F} there) of these two categories. So we will for now consider the first category. (Usefulness of the second category for our research is questionable.)

Let $f : A \rightarrow B$ be a function, \mathcal{A} be a filter on A .

PROPOSITION 1939. $\left\{ \frac{Y \in \mathcal{P}B}{\langle f^{-1} \rangle^* Y \in \mathcal{A}} \right\}$ is a filter.

PROOF. That it is an upper set is obvious.

Let $Y_0, Y_1 \in \left\{ \frac{Y \in \mathcal{P}B}{\langle f^{-1} \rangle^* Y \in \mathcal{A}} \right\}$. Then $\langle f^{-1} \rangle^* Y_0 \in \mathcal{A}$ and $\langle f^{-1} \rangle^* Y_1 \in \mathcal{A}$. We have

$$\langle f^{-1} \rangle^* (Y_0 \cap Y_1) = \langle f^{-1} \rangle^* Y_0 \cap \langle f^{-1} \rangle^* Y_1 \in \mathcal{A}$$

since f is monovalued. Thus $Y_0 \cap Y_1 \in \left\{ \frac{Y \in \mathcal{P}B}{\langle f^{-1} \rangle^* Y \in \mathcal{A}} \right\}$. □

THEOREM 1940. **FixMe: Should be moved above in the book.** $\left\{ \frac{Y \in \mathcal{P}B}{\langle f^{-1} \rangle^* Y \in \mathcal{A}} \right\}$ is equal to the filter generated by the filter base $\langle \langle f \rangle^* \rangle^* \mathcal{A}$, for every filter \mathcal{A} .

PROOF. Denote $\mathcal{B} = \left\{ \frac{Y \in \mathcal{P}B}{\langle f^{-1} \rangle^* Y \in \mathcal{A}} \right\}$, $\mathcal{C} = \langle \langle f \rangle^* \rangle^* \mathcal{A}$.

Let $Y \in \mathcal{C}$. Then $Y = \langle f \rangle^* A$ where $A \in \mathcal{A}$. Then $\langle f^{-1} \rangle^* \langle f \rangle^* A \supseteq A$ and so $\langle f^{-1} \rangle^* \langle f \rangle^* A \in \mathcal{A}$. This proves $\langle f \rangle^* A \in \mathcal{B}$, that is $Y \in \mathcal{B}$.

Let now $Y \in \mathcal{B}$. Then $\langle f \rangle^* \langle f^{-1} \rangle^* Y \subseteq Y$. Since $\langle f^{-1} \rangle^* Y \in \mathcal{A}$, we have that Y is a supset of some set of the form $\langle f \rangle^* A$, so $Y \in \mathcal{C}$. □

COROLLARY 1941. $\text{up}\langle f \rangle \mathcal{A} = \left\{ \frac{Y \in \mathcal{P}B}{\langle f^{-1} \rangle^* Y \in \text{up}\mathcal{A}} \right\}$.

DEFINITION 1942. The *category of filtered sets* **Filt** is the category defined as follows:

- 1°. Objects are pairs (A, \mathcal{A}) where A is a (small) set and \mathcal{A} is a filter on A .
- 2°. Morphisms from (A, \mathcal{A}) to (B, \mathcal{B}) are functions $f : A \rightarrow B$ such that $\langle f \rangle \mathcal{A} \sqsubseteq \mathcal{B}$.
- 3°. Identities are identity functions.

To verify that it is a category is straightforward.

It is the same category as \mathcal{F} in [1], as follows from an above proposition.

We will prove that starred reoidal product is a categorical product in this category. First we will prove the special case that binary reoidal product is a categorical product in this category.

THEOREM 1943. \times^{RLD} (together with projections Pr_0 and Pr_1) is a categorical product in **Filt**.

PROOF. Let our objects be \mathcal{A}, \mathcal{B} .

Denote p the left projection from $\text{Base}(\mathcal{A}) \times \text{Base}(\mathcal{B})$ to $\text{Base}(\mathcal{A})$.

We need to check that p is a **Filt**-morphism that is $p(\mathcal{A} \times^{\text{RLD}} \mathcal{B}) \sqsubseteq \mathcal{A}$ what is obvious.

Similarly for the right projection q .

It remains to check the universal property: Let \mathcal{C} be a filter and $f : \mathcal{C} \rightarrow \mathcal{A}$, $g : \mathcal{C} \rightarrow \mathcal{B}$. We need to prove that there are a unique $u : \mathcal{C} \rightarrow \mathcal{A} \times^{\text{RLD}} \mathcal{B}$ such that $f = p \circ u$ and $g = q \circ u$. Denote $h(z) = (f(z), g(z))$.

h is the unique function $\text{Base}(\mathcal{C}) \rightarrow \text{Base}(\mathcal{A}) \times \text{Base}(\mathcal{B})$ such that $f = p \circ h$ and $g = q \circ h$, so it remains to check that h is a morphism of **Filt** that is $\langle h \rangle \mathcal{C} \sqsubseteq \mathcal{A} \times^{\text{RLD}} \mathcal{B}$, what obviously follows from $\langle f \rangle \mathcal{C} \sqsubseteq \mathcal{A}$ and $\langle g \rangle \mathcal{C} \sqsubseteq \mathcal{B}$. \square

THEOREM 1944. \prod^{RLD^*} together with projections Pr_k is a categorical product in **Filt**.

PROOF. Consider an indexed family \mathcal{A} of objects.

Denote p_k the k -th projection from $\prod_{i \in \text{dom } \mathcal{A}} \text{Base}(\mathcal{A}_i)$.

We need to check that p_k is a **Filt**-morphism that is $p_k(\prod^{\text{RLD}^*} \mathcal{A}) \sqsubseteq \mathcal{A}_k$ what is obvious.

It remains to check the universal property: Let \mathcal{C} be a filter and $f_k : \mathcal{C} \rightarrow \mathcal{A}_k$. We need to prove that there are a unique $u : \mathcal{C} \rightarrow \prod^{\text{RLD}^*} \mathcal{A}$ such that $f_k = p_k \circ u$. Denote $h(z) = \lambda i \in \text{dom } \mathcal{A} : f_i z$.

h is the unique function $\text{Base}(\mathcal{C}) \rightarrow \prod_{i \in \text{dom } \mathcal{A}} \text{Base}(\mathcal{A}_i)$ such that $f_k = p_k \circ h$, so it remains to check that h is a morphism of **Filt** that is $\langle h \rangle \mathcal{C} \sqsubseteq \prod^{\text{RLD}^*} \mathcal{A}$. It follows from

$$\text{Pr}_i^{\text{RLD}} \langle h \rangle \mathcal{C} = \prod \langle \text{Pr}_i \rangle^* \langle h \rangle^* \text{up } \mathcal{C} = \prod \langle \text{Pr}_i \circ h \rangle^* \text{up } \mathcal{C} = \prod \langle f_i \rangle^* \text{up } \mathcal{C} = \langle f_i \rangle \mathcal{C} \sqsubseteq \mathcal{A}_i.$$

\square

Power of filters

1. Germs of functions

DEFINITION 1945. Functions $f, g \in \mathbf{Rel}(\mathbf{Ob} \mathcal{X}, B)$ are of the same \mathcal{X} -germ for a filter object \mathcal{X} iff there exists $X \in \text{up} \mathcal{X}$ such that $f|_X = g|_X$.

PROPOSITION 1946. Being of the same germ is an equivalence relation.

PROOF.

Reflexivity. Take arbitrary $X \in \text{up} \mathcal{X}$.

Symmetry. Obvious.

Transitivity. Let $f|_X = g|_X$ and $g|_Y = h|_Y$. Then $f|_{X \cap Y} = h|_{X \cap Y}$.

□

DEFINITION 1947. A *germ* is an equivalence class of being the same germ.

OBVIOUS 1948. Every germ is a filter on \mathbf{Set} .

THEOREM 1949. Let A, B be sets.

The following are mutually inverse bijections between monovalued reloids $f : A \rightarrow B$ with $\text{dom} f = \mathcal{X}$ and \mathcal{X} -germs S of functions $A \rightarrow B$ for $\mathcal{X} \in \mathcal{F}A$:

- 1°. $f \mapsto \text{up}^{\mathbf{Set}} f$;
- 2°. $S \mapsto s|_{\mathcal{X}}$ if $s \in S$.

The second bijection can also be written as $S \mapsto (\prod^{\mathbf{RLD}} S)|_{\mathcal{X}}$ or if $\text{card} B \neq 1$ as $S \mapsto \prod^{\mathbf{RLD}} S$.

REMARK 1950. $s|_{\mathcal{X}}$ is always defined because S is nonempty (it is an equivalence class).

PROOF. First prove that $\text{up}^{\mathbf{Set}} f$ is an \mathcal{X} -germ. Really, $F \in \text{up}^{\mathbf{Set}} f \Leftrightarrow F \sqsupseteq f \Leftrightarrow F|_{\mathcal{X}} = f \Leftrightarrow \exists X \in \text{up} \mathcal{X} : F|_X \sqsupseteq f$; thus $F, G \in \text{up}^{\mathbf{Set}} f \Rightarrow \exists X \in \text{up} \mathcal{X} : F|_X \sqsupseteq f \wedge G|_X \sqsupseteq f \Rightarrow \exists X \in \text{up} \mathcal{X} : F|_{X \cap Y} \sqsupseteq f \wedge G|_{X \cap Y} \sqsupseteq f \Rightarrow \exists Z \in \text{up} \mathcal{X} : (F|_Z \sqsupseteq f \wedge G|_Z \sqsupseteq f) \Rightarrow \exists Z \in \text{up} \mathcal{X} : (F \sqcap G)|_Z \sqsupseteq f$ and $F \in \text{up}^{\mathbf{Set}} f \wedge \exists X \in \text{up} \mathcal{X} : F|_X = G|_X \Rightarrow F \sqsupseteq f \wedge F|_X = G|_X \Rightarrow G|_X \sqsupseteq f \Rightarrow G \in \text{up}^{\mathbf{Set}} f$. We have proved that $\text{up}^{\mathbf{Set}} f$ is an equivalence class of the suitable equivalence relation, that is $\text{up}^{\mathbf{Set}} f$ is an \mathcal{X} -germ.

That $\prod^{\mathbf{RLD}} S$ is a monovalued reloid is obvious. Also $\text{im} \prod^{\mathbf{RLD}} S = \mathcal{X}$ is obvious.

Now prove that our correspondences are mutually inverse.

Let $f_0 : A \rightarrow B$ be a monovalued reloid and $\text{dom} f_0 = \mathcal{X}$. Let $S = \text{up}^{\mathbf{Set}} f_0$ and $f_1 = s|_{\mathcal{X}}$ for an $s \in S$. We need to prove $f_1 = f_0$. Really, $f_1 = F|_{\mathcal{X}}$ for an $F \in \text{up}^{\mathbf{Set}} f_0$; thus $f_1 = f_0$.

Let S_0 be an \mathcal{X} -germ of functions $A \rightarrow B$. Let $f = s|_{\mathcal{X}}$ for an $s \in S_0$ and $S_1 = \text{up}^{\mathbf{Set}} f$. We need to prove $S_1 = S_0$. Really,

$$S_1 = \text{up}^{\mathbf{Set}}(s|_{\mathcal{X}}) = \left\{ \frac{F \in \mathbf{Set}}{F \sqsupseteq s|_{\mathcal{X}}} \right\} = \left\{ \frac{F \in \mathbf{Set}}{\exists X \in \text{up} \mathcal{X} : F|_X \sqsupseteq s|_X} \right\} = \left\{ \frac{F \in \mathbf{Set}}{\exists X \in \text{up} \mathcal{X} : F|_X = s|_X} \right\} = S_0.$$

$$\left(\prod^{\mathbf{RLD}} S \right)|_{\mathcal{X}} = \prod_{s \in S}^{\mathbf{RLD}} s|_{\mathcal{X}} = s|_{\mathcal{X}} \text{ for every choice of } s \in S.$$

We can assume that $B \neq \emptyset$ because otherwise the theorem is obvious. Thus we can assume $\text{card } B > 1$.

If $\mathcal{X} = X$ then obviously S has just one element F and $\text{im} \prod^{\text{RLD}} S = \text{im } F = X = \mathcal{X}$. Otherwise for every $X \in \text{up } \mathcal{X}$ there are elements F, G of S such that $\text{dom}(F \sqcap G) \sqsubseteq X$ (using $\text{card } B > 1$).

By properties of generalized filter bases $X \times \top \sqsupseteq \prod^{\text{RLD}} S \Leftrightarrow \exists F, G \in S : X \times \top \sqsupseteq F \sqcap G \Leftrightarrow X \sqsupseteq \mathcal{X}$. Thus $\text{im} \prod^{\text{RLD}} S = \mathcal{X}$. \square

2. Power of filters

Let's define $\mathcal{Y}^{\mathcal{X}}$ for filters \mathcal{X}, \mathcal{Y} :

First define $Y^{\mathcal{X}}$ for a set Y :

$$Y^{\mathcal{X}} = \left\{ \frac{f \in \text{RLD}(\text{Ob } \mathcal{X}, Y)}{\text{dom } f = \mathcal{X} \wedge f \text{ is monovalued}} \right\}.$$

Now $\mathcal{Y}^{\mathcal{X}} = \prod_{Y \in \text{up } \mathcal{Y}}^{\text{RLD}} Y^{\mathcal{X}}$.

[1] defines an isomorphism to this way to define "exponentiation" of filters.

TODO: Check $\mathcal{Y}^1 \cong \mathcal{Y}$; $\mathcal{Z}^{\mathcal{X} \times^{\text{RLD}} \mathcal{Y}} \cong (\mathcal{Z}^{\mathcal{X}})^{\mathcal{Y}}$; $\mathcal{Z}^{\mathcal{X} \text{II} \mathcal{Y}} \cong \mathcal{Z}^{\mathcal{X}} \times^{\text{RLD}} \mathcal{Z}^{\mathcal{Y}}$; $\mathcal{Y}^2 \cong \mathcal{Y} \times^{\text{RLD}} \mathcal{Y}$; $\mathcal{Y}^0 \cong 1$; $\mathcal{Y}^N \cong \prod_{n \in N}^{\text{RLD}} \mathcal{Y}$. More formulas at https://en.wikipedia.org/wiki/Cartesian_closed_category.

Andreas Blass says in a private email that it is not cartesian closed: "Unfortunately, the two categories of filters in my paper are not cartesian closed. This is mentioned in a parenthetical comment near the bottom of page 141. The operation of cartesian product with the cofinite filter on the natural numbers has no right adjoint, because it does not preserve infinite coproducts." about [1].

But it is probably a braided closed monoidal category?

See [1] for more categorical properties of filters.

Matters related to tensor product

These consideration on (possibly infinite) indexed families of join-semilattices is based on [6] (for the finite case).

Let \mathfrak{A} be an indexed family of join-semilattices with least elements. Let T also be a join-semilattice.

Let $F(X)$ mean free join-semilattice for a set X .

DEFINITION 1951. **SepJoin** $(\prod \mathfrak{A}, T)$ is the set of maps from $\prod \mathfrak{A}$ to T , preserving joins in every argument $i \in \text{dom } \mathfrak{A}$.

OBVIOUS 1952. The set of free join-semilattices $F(X)$ is order-isomorphic to the set of subsets X of a “universal” set \mathcal{U} .

Let $i : \prod \mathfrak{A} \rightarrow F(\prod \mathfrak{A})$ be the universal embedding.

Let \sim be defined as the smallest equivalence relation on $F(\prod \mathfrak{A})$ that for every $k \in \text{dom } \mathfrak{A}$, $L \in \prod_{i \in (\text{dom } \mathfrak{A}) \setminus \{k\}} \mathfrak{A}_i$:

- 1°. $i(L \cup \{(k, g \sqcup h)\}) \sim i(L \cup \{(k, g)\}) \sqcup i(L \cup \{(k, h)\})$;
- 2°. $\perp \sim i(L \cup \{(k, \perp)\})$;
- 3°. $x \sim y \wedge x' \sim y' \Rightarrow x \sqcup x' \sim y \sqcup y'$ for all $x, y, x', y' \in F(\prod \mathfrak{A})$.

OBVIOUS 1953. Some function $h : X \rightarrow Y$ induces a well defined map $\psi : X/E \rightarrow Y$ on equivalence classes, if $E \subseteq F$ where $x F y \Leftrightarrow hx = hy$.

LEMMA 1954. The set of join-homomorphisms $\psi : F(\prod \mathfrak{A})/\sim \rightarrow T$ is isomorphic to the set of maps $\phi : \prod \mathfrak{A} \rightarrow T$ preserving finite joins in separate arguments.

PROOF. The quotient map $q : F(\prod \mathfrak{A}) \rightarrow F(\prod \mathfrak{A})/\sim$ which takes an element x to its equivalence class $[x]$ map is well defined because

$$x \sim y \wedge x' \sim y' \Rightarrow x \sqcup x' \sim y \sqcup y'.$$

The map q preserves join. $F(\prod \mathfrak{A})/\sim$ is associative, commutative, and idempotent since it is so on $F(\prod \mathfrak{A})$ and thus is a join-semilattice.

Let join-preserving map $\psi : F(\prod \mathfrak{A})/\sim \rightarrow T$. It is easy to show that $\psi \circ q \circ i$ preserves joins in separate arguments.

Let now $\phi : \prod \mathfrak{A} \rightarrow T$ preserves joins in separate arguments. There is a unique join-preserving map $\tilde{\phi} : F(\prod \mathfrak{A}) \rightarrow T$ such that $\tilde{\phi} \circ i = \phi$. We must show that this induces a well-defined join-preserving map $\psi : F(\prod \mathfrak{A})/\sim \rightarrow T$ such that $\psi(q(x)) = \tilde{\phi}(x)$ for all $x \in F(\prod \mathfrak{A})$ (clearly at most one function ψ can satisfy this equation since q is surjective). This will show that ψ bijectively correspond to $\tilde{\phi}$ and thus bijectively correspond to ϕ . (This will finish the proof as that this bijection is monotone is obvious.)

Using the “obvious” above, it’s enough (taking into account that \sim is the minimal equivalence relation subject to the above formulas) to prove that:

- 1°. $\tilde{\phi}(i(L \cup \{(k, g \sqcup h)\})) = \tilde{\phi}(i(L \cup \{(k, g)\}) \sqcup i(L \cup \{(k, h)\}))$;
- 2°. $\tilde{\phi}(\perp) = \tilde{\phi}(i(L \cup \{(k, \perp)\}))$;
- 3°. $\tilde{\phi}(x) = \tilde{\phi}(y) \wedge \tilde{\phi}(x') = \tilde{\phi}(y') \Rightarrow \tilde{\phi}(x \sqcup x') = \tilde{\phi}(y \sqcup y')$

The first easily follows from $\tilde{\phi} \circ i = \phi$ and the fact that $\tilde{\phi}$ preserves binary joins.

The second easily follows from $\tilde{\phi} \circ i = \phi$ and that ϕ preserves \perp .

The third follows from the fact that $\tilde{\phi}$ preserves joins. \square

COROLLARY 1955. The poset of prestaroids $\mathbf{preStrd}(\mathfrak{A})$ is isomorphic to an ideal (on a join-semilattice), provided that \mathfrak{A} is an indexed family of join-semilattices.

PROOF. $\mathbf{preStrd}(\mathfrak{A}) \cong \mathbf{SepJoin}(\mathfrak{A}, 2) \cong F(\prod \mathfrak{A}) / \sim \rightarrow 2 \cong \mathfrak{J}(F(\prod \mathfrak{A}) / \sim)$. \square

FiXme: Check below (especially posets vs dual posets) for errors.

COROLLARY 1956. $\mathbf{preStrd}$ is a complete lattice.

PROOF. Corollary 496. \square

COROLLARY 1957. $\mathbf{preStrd}$ is a filtered filtrator.

PROOF. Theorem 511. \square

FiXme: Try to prove that $\mathbf{preStrd}$ is atomic and moreover atomistic (under certain conditions). Other properties?

Categories related with functors

I consider some categories related with pointfree functors.

1. Draft status

This is a rough partial draft.

2. Topic of this article

In this article are considered some categories related to *pointfree functors*.

3. Category of continuous morphisms

I will denote $\text{Ob } f$ the object (source and destination) of an endomorphism f .

DEFINITION 1958. Let C is a partially ordered category. The category $\text{cont}(C)$ (which I call *the category of continuous morphism over C*) is:

- Objects are endomorphisms of category C .
- Morphisms are triples (f, a, b) where a and b are objects and $f : \text{Ob } a \rightarrow \text{Ob } b$ is a morphism of the category C such that $f \circ a \sqsubseteq b \circ f$.
- Composition of morphisms is defined by the formula $(g, b, c) \circ (f, a, b) = (g \circ f, a, c)$.
- Identity morphisms are $(a, a, 1_a^C)$.

It is really a category:

PROOF. We need to prove that: composition of morphisms is a morphism, composition is associative, and identity morphisms can be canceled on the left and on the right.

That composition of morphisms is a morphism follows from these implications:

$$f \circ a \sqsubseteq b \circ f \wedge g \circ b \sqsubseteq c \circ g \Rightarrow g \circ f \circ a \sqsubseteq g \circ b \circ f \sqsubseteq c \circ g \circ f.$$

That composition is associative is obvious.

That identity morphisms can be canceled on the left and on the right is obvious. \square

REMARK 1959. The “physical” meaning of this category is:

- Objects (endomorphisms of C) are spaces.
- Morphisms are continuous functions between spaces.
- $f \circ a \sqsubseteq b \circ f$ intuitively means that f combined with an infinitely small is less than infinitely small combined with f (that is f is continuous).

REMARK 1960. Every $\text{Hom}(\mathfrak{A}, \mathfrak{B})$ of \mathbf{Pos} is partially ordered by the formula $a \leq b \Leftrightarrow \forall x \in \mathfrak{A} : a(x) \leq b(x)$. So $\text{cont}(\mathbf{Pos})$ is defined.

DEFINITION 1961. I call a \mathbf{Pos} -morphism *monovalued* when it maps atoms to atoms or least element.

DEFINITION 1962. I call a \mathbf{Pos} -morphism *entirely defined* when its value is non-least on every non-least element.

OBVIOUS 1963. A morphism is both monovalued and entirely defined iff it maps atoms into atoms.

FixMe: Show how it relates with dagger categories.

DEFINITION 1964. **mePos** is the subcategory of **Pos** with only monovalued and entirely defined morphisms.

OBVIOUS 1965. This is a well defined category.

DEFINITION 1966. **mefpFCD** is the subcategory of **fpFCD** with only monovalued and entirely defined morphisms.

REMARK 1967. In the two above definitions different definitions of monovaluedness and entire definedness from different articles.

4. Definition of the categories

DEFINITION 1968. A (*pointfree*) *endo-funcoïd* is a (pointfree) funcoïd with the same source and destination (an endomorphism of the category of (pointfree) funcoïds). I will denote $\text{Ob } f$ the object of an endomorphism f .

OBVIOUS 1969. The *category of continuous pointfree funcoïds* $\text{cont}(\mathbf{fpFCD})$ is:

- Objects are small pointfree endo-funcoïds.
- Morphisms from an object a to an object b are triples (f, a, b) where f is a pointfree funcoïd from $\text{Ob } a$ to $\text{Ob } b$ such that f is a continuous morphism from a to b (that is $f \circ a \sqsubseteq b \circ f$, or equivalently $a \sqsubseteq f^{-1} \circ b \circ f$, or equivalently $f \circ a \circ f^{-1} \sqsubseteq f$).
- Composition is the composition of pointfree funcoïds.
- Identity for an object a is $(I_{\text{Ob } a}^{\text{FCD}}, a, a)$.

5. Isomorphisms

THEOREM 1970. If f is an isomorphism $a \rightarrow b$ of the category $\text{cont}(\mathbf{fpFCD})$, then:

- 1°. $f \circ a = b \circ f$;
- 2°. $a = f^{-1} \circ b \circ f$;
- 3°. $f \circ a \circ f^{-1} = b$.

PROOF. Note that f is monovalued and entirely defined.

1. We have $f \circ a \sqsubseteq b \circ f$ and $f^{-1} \circ b \sqsubseteq a \circ f^{-1}$. Consequently $f^{-1} \circ f \circ a \sqsubseteq f^{-1} \circ b \circ f$; $a \sqsubseteq f^{-1} \circ b \circ f$; $a \circ f^{-1} \sqsubseteq f^{-1} \circ b \circ f \circ f^{-1}$; $a \circ f^{-1} \sqsubseteq f^{-1} \circ b$. Similarly $b \circ f \sqsubseteq f \circ a$. So $f \circ a = b \circ f$.

2 and 3. Follow from the definition of isomorphism. □

Isomorphisms are meant to preserve structure of objects. I will show that (under certain conditions) isomorphisms of $\text{cont}(\mathbf{fpFCD})$ really preserve structure of objects.

First we will consider an isomorphism between objects a and b which are funcoïds (not the general case of pointfree funcoïds). In this case a map which preserves structure of objects is a *bijection*. It is really a bijection as the following theorem says:

THEOREM 1971. If f is an isomorphism of the category of funcoïds then f is a discrete funcoïd (so, it is essentially a bijection). **FixMe:** Split it into two propositions: about completeness and co-completeness.

PROOF. $\langle f \rangle^* A \sqcap \langle f \rangle^* ((\text{Src } f) \setminus A) = 0^{\text{Dst } f}$ because f is monovalued.
 $\langle f \rangle^* A \sqcup \langle f \rangle^* ((\text{Src } f) \setminus A) = 1^{\text{Dst } f}$.

Therefore $\langle f \rangle^* A$ is a principal filter (theorem 49 in [4]). So f is co-complete.
 That f is complete follows from symmetry. \square

For wider class of pointfree functors the concept of bijection does not make sense. Instead we would want a structure preserving map to be *order isomorphism*.

Actually, for mapping between $\mathcal{P}A$ and $\mathcal{P}B$ where A and B are some sets (including the above considered case of functors from A to B) bijection and order isomorphism are essentially the same:

PROPOSITION 1972. Bijections F between sets A and B bijectively correspond to order isomorphisms f between $\mathcal{P}A$ and $\mathcal{P}B$ by the formula $f = \langle F \rangle$.

PROOF. Let F is a bijection. Then $X \subseteq Y \Rightarrow \langle F \rangle X \subseteq \langle F \rangle Y$ and $\langle F^{-1} \rangle \langle F \rangle X = X$ for every sets $X, Y \in \mathcal{P}A$. Thus $f = \langle F \rangle$ is an order isomorphism.

Let now f is an order isomorphism between $\mathcal{P}A$ and $\mathcal{P}B$. Then $f(\{x\})$ is a singleton for every $x \in A$. Take $F(x)$ to the unique y such that $f(\{x\}) = \{y\}$. Obviously f is a bijection and $f = \langle F \rangle$. \square

For arbitrary pointfree functors isomorphisms do not necessarily preserve structure. It holds only for *increasing pointfree functors*:

DEFINITION 1973. I call a pointfree functor f *increasing* iff $\langle f \rangle$ and $\langle f^{-1} \rangle$ are monotone functions.

PROPOSITION 1974. If f is an increasing isomorphism of the category of pointfree functors then $\langle f \rangle$ is an order isomorphism.

PROOF. We have: $\langle f \rangle \circ \langle f^{-1} \rangle = \langle f \circ f^{-1} \rangle = \langle \text{id}_{\mathfrak{B}}^{\text{FCD}} \rangle = \text{id}_{\mathfrak{B}}$ and $\langle f^{-1} \rangle \circ \langle f \rangle = \langle f^{-1} \circ f \rangle = \langle \text{id}_{\mathfrak{A}}^{\text{FCD}} \rangle = \text{id}_{\mathfrak{A}}$. Thus $\langle f \rangle$ is a bijection.

$\langle f \rangle$ is increasing and bijective. \square

REMARK 1975. Non-increasing isomorphisms of the category of pointfree functors are against sound mind, they don't preserve the structure of the source, that is for them $\langle f \rangle$ or $\langle f^{-1} \rangle$ are not order isomorphisms.

OBVIOUS 1976. Isomorphisms of $\text{cont}(\mathbf{Pos})$ and $\text{cont}(\mathbf{mePos})$ are order isomorphisms.

6. Direct products

FiXme: Now this section is a complete mess. Clean it up.

Consider the category $\mathbf{contFcd}$ which is the full subcategory $\text{cont}(\mathbf{mePos})$ restricted to objects which are essentially increasing pointfree functors.

Let $f_1 : Y \rightarrow X_1$ and $f_2 : Y \rightarrow X_2$ are morphisms of $\mathbf{contFcd}$.

The product object is $X_1 \times^{(C)} X_2$ (cross composition product of functors used). It is easy to see that $X_1 \times^{(C)} X_2$ is an object of $\mathbf{contFcd}$ that is an endo-functor.

The morphism $f_1 \times^{(D)} f_2 : Y \rightarrow X_1 \times^{(C)} X_2$ is defined by the formula $(f_1 \times^{(D)} f_2)y = f_1 y \times^{\text{FCD}} f_2 y$.

$f_1 \times^{(D)} f_2$ is monovalued and entirely defined because so are f_1 and f_2 .

$$(f_1 \times^{(D2)} f_2)y = \bigcup \{f_1 Y \times^{\text{FCD}} f_2 Y \mid Y \in \text{atoms}^{\mathfrak{A}} y\}.$$

FiXme: Is $(f_1 \times^{(D2)} f_2)$ a pointfree functor?

To prove that it is really a morphism we need to show

$$(f_1 \times^{(D)} f_2) \circ Y \sqsubseteq (X_1 \times^{(C)} X_2) \circ (f_1 \times^{(D)} f_2)$$

that is (for every y)

$$(f_1 \times^{(D)} f_2)Yy \subseteq (X_1 \times^{(C)} X_2)(f_1 \times^{(D)} f_2)y.$$

Really, $(f_1 \times^{(D)} f_2)Yy = f_1Yy \times^{\text{FCD}} f_2Yy$;

$$(X_1 \times^{(C)} X_2)(f_1 \times^{(D)} f_2)y = (X_1 \times^{(C)} X_2)(f_1y \times^{\text{FCD}} f_2y) = X_1f_1y \times^{\text{FCD}} X_2f_2y;$$

but it is easy to show $f_1Yy \times^{\text{FCD}} f_2Yy \subseteq X_1f_1y \times^{\text{FCD}} X_2f_2y$.

??

I define ??

Fixme: Prove that it is a direct product in **contFcd**.

Product of functors over a filter

The following definition is inspired by the usual definition of Tychonoff product of topological spaces.

DEFINITION 1977. Let f be an indexed family of functors. Let \mathcal{F} be a filter on $\text{dom } f$.

$$a \left[\prod^{[\mathcal{F}]} f \right] b \Leftrightarrow \exists N \in \mathcal{F} \forall i \in N : \Pr_i^{\text{RLD}} a [f_i] \Pr_i^{\text{RLD}} b$$

for atomic reloids a and b .

REMARK 1978. We are especially interested in the special case when \mathcal{F} is the cofinite filter. In this case $a \left[\prod^{[\mathcal{F}]} f \right] b$ is defined by the condition that $\Pr_i^{\text{RLD}} a [f_i] \Pr_i^{\text{RLD}} b$ for an infinite number of indexes i .

$$\text{OBVIOUS 1979. } a \left[\prod^{[\Gamma^{\mathcal{F}(\text{dom } f)}]} f \right] b \Leftrightarrow a \left[\prod^{(A)} f \right] b.$$

PROPOSITION 1980. $\neg(\mathcal{X} [f] \mathcal{Y})$ implies $\neg(X [f] Y)$ for some $X \in \text{up } \mathcal{X}$, $Y \in \text{up } \mathcal{Y}$.

PROOF. Suppose $\neg(\mathcal{X} [f] \mathcal{Y})$. Then $\mathcal{Y} \asymp \langle f \rangle \mathcal{X}$. Thus by separability of core for filters $\mathcal{Y} \asymp \langle f \rangle \mathcal{X}$ for some $Y \in \text{up } \mathcal{Y}$, that is $\neg(\mathcal{X} [f] Y)$. Apply this result twice. \square

LEMMA 1981.

$$\forall X \in \prod_{i \in D} \text{up } a_i, Y \in \prod_{i \in D} \text{up } b_i \exists x \in \prod_{i \in D} \text{atoms } \uparrow X_i, y \in \prod_{i \in D} \text{atoms } \uparrow Y_i \exists N \in \mathcal{F} \forall j \in N : x_j [f_j] y_j$$

implies $\exists N \in \mathcal{F} \forall i \in N : a_i [f_i] b_i$.

PROOF. Suppose for the contrary $\neg(a_i [f_i] b_i)$ for all $i \in N$ where $N \in \mathcal{F}$ (i.e. for an infinite number of indexes if \mathcal{F} is the cofinite filter). Then (lemma above) there are $X_i \in \text{up } a_i$ and $Y_i \in \text{up } b_i$ such that $\neg(X_i [f_j]^* Y_i)$ for $i \in N$. Thus $\neg(x_i [f_i] y_i)$ for $i \in N$, contrary to the condition. \square

PROPOSITION 1982. The functor $\prod^{[\mathcal{F}]} f$ exists.

PROOF. We need to prove that

$$\forall X \in \text{up } a, Y \in \text{up } b \exists x \in \text{atoms } \uparrow^{\text{RLD}} X, y \in \text{atoms } \uparrow^{\text{RLD}} Y : x \left[\prod^{(A2)} f \right] y$$

implies $a \left[\prod^{[\mathcal{F}]} f \right] b$.

Equivalently transforming it: **FixMe: More detailed proof.**

$$\begin{aligned} & \forall X \in \text{up } a, Y \in \text{up } b \exists x \in \text{atoms } \uparrow^{\text{RLD}} X, y \in \text{atoms } \uparrow^{\text{RLD}} Y \\ & \exists N \in \mathcal{F} \forall i \in N : \Pr_i^{\text{RLD}} x [f_i] \Pr_i^{\text{RLD}} y; \\ & \forall X \in \text{up } a, Y \in \text{up } b \exists x \in \prod_{i \in \text{dom } f} \text{atoms } \uparrow^{\text{RLD}} X_i, y \in \prod_{i \in \text{dom } f} \text{atoms } \uparrow^{\text{RLD}} Y_i \\ & \exists N \in \mathcal{F} \forall i \in N : x_i [f_i] y_i; \end{aligned}$$

$$\forall X \in \prod_{i \in D} \text{up } a_i, Y \in \prod_{i \in D} \text{up } b_i \exists x \in \prod_{i \in D} \text{atoms } \uparrow X_i, y \in \prod_{i \in D} \text{atoms } \uparrow Y_i \exists N \in \mathcal{F} \forall j \in N : x_j [f_j] y_j$$

where $D = \text{dom } f$.

Thus by the lemma $\exists N \in \mathcal{F} \forall i \in N : a_i [f_i] b_i$, that is $a \left[\prod^{[\mathcal{F}]} f \right] b$. \square

FiXme: TODO: when $\text{Pr}_j \prod_{i \in D}^{[\mathcal{F}]} a_i = a_j$?

1. More on product of reloids

FiXme: Move this to a more appropriate place.

DEFINITION 1983. $\prod_{i \in \text{dom } f}^{(Y)} f = \prod_{i \in \text{dom } f}^{(A)} (\text{FCD})f$ for an indexed family f of reloids.

PROPOSITION 1984.

$$a \left[\prod_{i \in \text{dom } f}^{(Y)} f \right] b \Leftrightarrow \forall i \in \text{dom } f : f_i \not\prec_{\text{Pr}_i}^{\text{RLD}} a \times^{\text{RLD}} \text{Pr}_i^{\text{RLD}} b.$$

PROOF. $f_i \not\prec_{\text{Pr}_i}^{\text{RLD}} a \times^{\text{FCD}} \text{Pr}_i^{\text{RLD}} b \Leftrightarrow (\text{FCD})f_i \sqsupseteq \text{Pr}_i^{\text{RLD}} a \times^{\text{FCD}} \text{Pr}_i^{\text{RLD}} b \Leftrightarrow a \left[(\text{FCD})f_i \right] b$. \square

EXAMPLE 1985. The functor p described by the formula (for atomic reloids a and b)

$$a p b \Leftrightarrow \forall i \in \text{dom } f : f_i \sqsupseteq \text{Pr}_i^{\text{RLD}} a \times^{\text{RLD}} \text{Pr}_i^{\text{RLD}} b$$

does not exist (in general), even if we restrict to 2-indexed families only.

PROOF. For the case if $f = \llbracket v, w \rrbracket$ is a 2-indexed family of reloids, the formula which we need to disprove takes the form:

$$a p b \Leftrightarrow v \sqsupseteq \text{dom } a \times^{\text{RLD}} \text{dom } b \wedge w \sqsupseteq \text{im } a \times^{\text{RLD}} \text{im } b.$$

Take $v = w = 1^{\mathbf{Rel}}$ on an infinite set. Suppose for the contrary p exists and is a functor. Then

$$\forall X \in \text{up } a, Y \in \text{up } b \exists x \in \text{atoms } \uparrow X, y \in \text{atoms } \uparrow Y : x p y \Rightarrow a p b.$$

For a counter-example take $a = b$ to be a nontrivial ultrafilter. Then for every $X \in \text{up } a, Y \in \text{up } b$ take $x = y$ to be singletons on $X \cap Y$. We have $x p y$, but not $a p b$. \square

Compact funcoids

Compact funcoids are defined. Attempted to prove that under certain conditions the reloid corresponding to a compact funcoid is the neighborhood of the diagonal of the product funcoid.

This is a rough partial draft. The proofs are with errors.

FiXme: The below examples also show that subatomic product does not coincide with Tychonoff product.

1. The rest

DEFINITION 1986. A funcoid f is *directly compact* iff

$$\forall \mathcal{F} \in \mathfrak{F} : (\langle f \rangle \mathcal{F} \neq \perp \Rightarrow \text{Cor} \langle f \rangle \mathcal{F} \neq \perp).$$

OBVIOUS 1987. A funcoid f is directly compact iff $\forall a \in \text{atoms dom } f : \text{Cor} \langle f \rangle a \neq \perp$.

OBVIOUS 1988. A reflexive funcoid f is directly compact iff

$$\forall \mathcal{F} \in \mathfrak{F} : (\mathcal{F} \neq \perp \Rightarrow \text{Cor} \langle f \rangle \mathcal{F} \neq \perp).$$

DEFINITION 1989. A funcoid f is *reversely compact* iff f^{-1} is directly compact.

DEFINITION 1990. A funcoid is *compact* iff it is both directly compact and reversely compact.

PROPOSITION 1991. $\prod^{\text{RLD}} a = \uparrow^{\text{RLD}} \prod_{i \in \text{dom } a} (\uparrow^{\text{RLD}})^{-1} a_i$ for every indexed family a of principal filters.

PROOF. Because $\prod_{i \in \text{dom } a} (\uparrow^{\text{RLD}})^{-1} a_i \in \text{up } \prod^{\text{RLD}} a$. **FiXme:** More detailed proof. \square

LEMMA 1992. $\prod_{i \in \text{dom } a}^{\text{RLD}} \text{Cor } a_i = \text{Cor } \prod^{\text{RLD}} a$.

PROOF. $\text{Cor } \prod^{\text{RLD}} a = \prod \{ \uparrow^{\text{RLD}} \prod A \mid A \in \text{up } a \} = \uparrow^{\text{RLD}} \bigcap \{ \prod A \mid A \in \mathcal{P} \prod \mathfrak{A}, \forall i \in \text{dom } a : A_i \in \text{up } a_i \} = \uparrow^{\text{RLD}} \bigcap \{ \prod \bigcap K_i \mid K \in \mathcal{P} \mathcal{P} \prod \mathfrak{A}, \forall i \in \text{dom } a : K_i \in \mathcal{P} \text{up } a_i \} = \uparrow^{\text{RLD}} \bigcap \{ \prod (\uparrow^{\text{RLD}})^{-1} \text{Cor } a_i \mid i \in \text{dom } a \} = \uparrow^{\text{RLD}} \prod_{i \in \text{dom } a}^{\text{RLD}} \text{Cor } a_i$.

FiXme: Check for little errors. \square

COROLLARY 1993. $\prod_{i \in n}^{\text{RLD}} \langle \text{CoCompl } f_i \rangle \mathcal{X}_i = \langle \text{CoCompl } \prod^{(A)} f \rangle \prod^{\text{RLD}} \mathcal{X}$ for every n -indexed families f of funcoids and \mathcal{X} of filters on the same set (with $\text{Src } f_i = \text{Base}(\mathcal{X}_i)$ for every $i \in n$).

PROOF.

$$\begin{aligned}
\prod_{i \in n}^{\text{RLD}} \langle \text{CoCompl } f_i \rangle \mathcal{X}_i &= \\
\prod_{i \in n}^{\text{RLD}} \text{Cor} \langle f_i \rangle \mathcal{X}_i &= \\
\text{Cor} \prod_{i \in n}^{\text{RLD}} \langle f_i \rangle \mathcal{X}_i &= (*) \\
\text{Cor} \prod_{i \in n}^{\text{RLD}} \langle f_i \rangle \text{Pr}_i^{\text{RLD}} \left(\prod_{i \in n}^{\text{RLD}} \mathcal{X}_i \right) &= \\
\text{Cor} \left\langle \prod_{i \in n}^{(A)} f_i \right\rangle \prod_{i \in n}^{\text{RLD}} \mathcal{X}_i &= \\
\left\langle \text{CoCompl} \prod_{i \in n}^{(A)} f_i \right\rangle \prod_{i \in n}^{\text{RLD}} \mathcal{X}_i. &
\end{aligned}$$

(*) You should verify the special case when $\mathcal{X}_i = \perp^{\mathfrak{F}}$ for some i . \square

THEOREM 1994. Let f be an indexed family of functors. **FiXme: Reverse theorem (for non-least functors).**

- 1°. $\prod f$ is directly compact if every f_i is directly compact.
- 2°. $\prod f$ is reversely compact if every f_i is reversely compact.
- 3°. $\prod f$ is compact if every f_i is compact.

PROOF. It is enough to prove only the first statement.

Let each f_i is directly compact.

Let $\langle \prod f \rangle a \neq \perp$. Then $\langle \prod^{(A)} f \rangle a = \prod_{i \in \text{dom } f}^{\text{RLD}} \langle f_i \rangle \text{Pr}_i^{\text{RLD}} a$. Thus every $\langle f_i \rangle \text{Pr}_i^{\text{RLD}} a \neq \perp$. Consequently by compactness $\text{Cor} \langle f_i \rangle \text{Pr}_i^{\text{RLD}} a \neq \perp$; $\prod_{i \in \text{dom } f} \text{Cor} \langle f_i \rangle \text{Pr}_i^{\text{RLD}} a \neq \perp$; $\text{Cor} \prod_{i \in \text{dom } f} \langle f_i \rangle \text{Pr}_i^{\text{RLD}} a \neq \perp$; $\text{Cor} \langle \prod f \rangle a \neq \perp$.

So $\prod f$ is directly compact. \square

PROPOSITION 1995. The following expressions are pairwise equal:

- 1°. $\langle f \times^{(A)} f \rangle * 1^{\text{RLD}}$;
- 2°. $\sqcup \left\{ \frac{\langle f \times^{(A)} f \rangle p}{p \in \text{atoms } 1^{\text{RLD}}} \right\}$;
- 3°. $\sqcup \left\{ \frac{\langle f \rangle x \times^{\text{RLD}} \langle f \rangle x}{x \in \text{atoms } \mathfrak{F}} \right\}$;

PROOF.

1° \Leftrightarrow 2°. **Theorem 779.**

2° \Leftrightarrow 3°. $\sqcup \left\{ \frac{\langle f \times^{(A)} f \rangle p}{p \in \text{atoms } 1^{\text{RLD}}} \right\} = \sqcup \left\{ \frac{\langle f \rangle \text{dom } p \times^{\text{RLD}} \langle f \rangle \text{im } p}{p \in \text{atoms } 1^{\text{RLD}}} \right\} = \sqcup \left\{ \frac{\langle f \rangle x \times^{\text{RLD}} \langle f \rangle x}{x \in \text{atoms } \mathfrak{F}} \right\}$.

\square

PROPOSITION 1996. Let g be a reloid and $f = (\text{FCD})g$ and $f = f \circ f^{-1}$. Then $\langle f \times^{(A)} f \rangle * 1^{\text{RLD}} \sqsupseteq g$.

PROOF. $\langle f \times^{(A)} f \rangle * 1^{\text{RLD}} \not\approx^{\text{RLD}} Y \Leftrightarrow \uparrow^{\text{RLD}} 1^{\text{RLD}} [f \times^{(A)} f] \uparrow^{\text{RLD}} Y \Leftrightarrow \uparrow^{\text{FCD}} 1^{\text{RLD}} [f \times^{(C)} f] \uparrow^{\text{FCD}} Y \Leftrightarrow f \circ \uparrow^{\text{FCD}} 1^{\text{RLD}} \circ f^{-1} \not\approx^{\text{FCD}} Y \Leftrightarrow f \circ f^{-1} \not\approx^{\text{FCD}} Y \Leftrightarrow f \not\approx^{\text{FCD}} Y \Leftrightarrow f \sqcap \uparrow^{\text{FCD}} Y \neq \perp \Leftrightarrow (\text{RLD})_{\text{in}}(f \sqcap \uparrow^{\text{FCD}} Y) \neq \perp \Leftrightarrow (\text{RLD})_{\text{in}} f \sqcap (\text{RLD})_{\text{in}} \uparrow^{\text{FCD}} Y \neq \perp \Leftrightarrow (\text{RLD})_{\text{in}} f \sqcap (\text{RLD})_{\text{out}} \uparrow^{\text{FCD}} Y \neq \perp \Leftrightarrow (\text{RLD})_{\text{in}} f \sqcap \uparrow^{\text{RLD}} Y \neq \perp \Leftrightarrow (\text{RLD})_{\text{in}} (\text{FCD})g \sqcap \uparrow^{\text{RLD}} Y \neq \perp \Leftrightarrow g \sqcap \uparrow^{\text{RLD}} Y \neq \perp \Leftrightarrow g \not\approx^{\text{RLD}} Y$. \square

PROPOSITION 1997. Let g be a reloid and $f = (\text{FCD})g$ and $f = f \circ f^{-1}$. Then $\langle f \times^{\text{in}} f \rangle^* 1^{\text{RLD}} \supseteq g$.

PROOF. $\langle f \times^{\text{in}} f \rangle^* 1^{\text{RLD}} = \langle (\text{RLD})_{\text{in}} f \circ^{(C)} (\text{RLD})_{\text{in}} f \rangle^* 1^{\text{RLD}} = (\text{RLD})_{\text{in}} f \circ 1^{\text{RLD}} \circ (\text{RLD})_{\text{in}} f^{-1} = (\text{RLD})_{\text{in}} f \circ (\text{RLD})_{\text{in}} f^{-1} = (\text{RLD})_{\text{in}} (f \circ f^{-1}) = (\text{RLD})_{\text{in}} f = (\text{RLD})_{\text{in}} (\text{FCD})g \supseteq g$. \square

LEMMA 1998. $\text{Cor}\langle f \times^{(A)} f \rangle^* g \sqsubseteq 1^{\text{RLD}}$ if $(\text{FCD})g = f$ for a T_1 -separable reloid g .

1.1. Propositions from [2] which do not hold for our products. In this subsection I present counter-examples against modified propositions from [2] in which I replace Tychonoff product with our subatomic or cross-inner products.

TODO: Consider as a counter-example the non-transitive compact funcoid $\left\{ \frac{(x,y)}{x,y \in [0;1], |x-y| < \frac{1}{3}} \right\}$.

EXAMPLE 1999. $\langle 1^{\text{Rel}} \times^{(A)} 1^{\text{Rel}} \rangle^* 1^{\text{Rel}} \sqsupset 1^{\text{Rel}}$.

PROOF. $\langle 1^{\text{Rel}} \times^{(A)} 1^{\text{Rel}} \rangle^* 1^{\text{Rel}} = \bigsqcup_{x \in \text{atoms } 1^{\text{Rel}}} \langle 1^{\text{Rel}} \times^{(A)} 1^{\text{Rel}} \rangle^* x = \bigsqcup_{x \in \text{atoms } 1^{\text{Rel}}} \left(\langle 1^{\text{Rel}} \rangle^* \text{dom } x \times^{\text{RLD}} \langle 1^{\text{Rel}} \rangle^* \text{im } x \right) = \bigsqcup_{x \in \text{atoms } 1^{\text{Rel}}} (\text{dom } x \times^{\text{RLD}} \text{im } x) = \bigsqcup_{x \in \text{atoms } \mathcal{F}} (x \times^{\text{RLD}} x) \sqsupset 1^{\text{Rel}}$. \square

Statement 2 on page 172 of [2] does not survive modification:

EXAMPLE 2000.

- 1°. There is a funcoid f and $V \in \text{up } f$ such that $V \circ M \circ V^{-1} \notin \text{up}\langle f \times^{(A)} f \rangle^* M$.
- 2°. $\langle f \times^{(A)} f \rangle^* M \sqsupset g \circ \uparrow^{\text{RLD}} M \circ g^{-1}$ for some reloid g , binary relation M and the funcoid $f = (\text{FCD})g$.

PROOF.

- 1°. Take $f = M = V = 1^{\text{Rel}}$ and use the example above.
- 2°. Take $f = g = M = 1^{\text{Rel}}$ and use the example above.

\square

COROLLARY 2001. $\langle f \times^{(A)} f \rangle^* M \sqsubseteq \langle f \times^{(C)} f \rangle^* M$.

COROLLARY 2002. $V \circ V^{-1} \in \text{up}\langle f \times^{(A)} f \rangle^* 1^{\text{RLD}}$; $f \circ f^{-1} \supseteq \langle f \times^{(A)} f \rangle^* 1^{\text{RLD}}$.

PROOF. ?? \square

REMARK 2003. I attempted to generalize the below theorem more than the standard general topology theorem about correspondence of compact and uniform spaces, but haven't really succeeded much, as it appears to be needed that the reloid in question is reflexive, symmetric, and transitive, that is just a uniform space as in the standard general topology.

Does the reverse inequality hold, that is $g \supseteq \langle f \times^{(A)} f \rangle^* 1^{\text{RLD}}$ and/or $g \supseteq \langle f \times^{\text{in}} f \rangle^* 1^{\text{RLD}}$ (for compact $f = (\text{FCD})g$)?

THEOREM 2004. $g \sqsubseteq \langle f \times^{(A)} f \rangle^* 1^{\text{RLD}}$ for compact $f = (\text{FCD})g$. (We have already proved this in an easier way, and not only for compact funcoids.)

Suppose there is $U \in \text{up}\langle f \times^{(A)} f \rangle^* 1^{\text{RLD}}$ such that $U \notin \text{up } g$.

Then $\left\{ \frac{V \setminus U}{V \in \text{up } g} \right\} = g \setminus U$ would be a proper filter.

Thus by reflexivity $\langle f \times^{(A)} f \rangle^* (g \setminus U) \neq \perp$.

By compactness of $f \times^{(A)} f$, $\text{Cor}\langle f \times^{(A)} f \rangle^* (g \setminus U) \neq \perp$.

Suppose $\uparrow \{(x, x)\} \sqsubseteq \langle f \times^{(A)} f \rangle^*(g \setminus U)$; then $g \setminus U \not\sqsubseteq \langle f^{-1} \times^{(A)} f^{-1} \rangle \{(x, x)\}$; $U \sqsubseteq \langle f^{-1} \times^{(A)} f^{-1} \rangle \{(x, x)\} \sqsubseteq \langle f^{-1} \times^{(A)} f^{-1} \rangle 1^{\text{RLD}}$ what is impossible.

Thus there exist $x \neq y$ such that $\{(x, y)\} \sqsubseteq \text{Cor} \langle f \times^{(A)} f \rangle^*(g \setminus U)$. Thus $\{(x, y)\} \sqsubseteq \langle f \times^{(A)} f \rangle^* g$.

Thus by the lemma $\{(x, y)\} \sqsubseteq 1^{\text{RLD}}$ what is impossible. So $U \in \text{up } g$.

We have $\text{up} \langle f \times^{(A)} f \rangle^* 1^{\text{RLD}} \subseteq \text{up } g$; $\langle f \times^{(A)} f \rangle^* 1^{\text{RLD}} \supseteq g$.

COROLLARY 2005. Let f is a T_1 -separable (the same as T_2 for symmetric transitive) compact funcoid and g is a uniform space (reflexive, symmetric, and transitive endoreloid) such that $(\text{FCD})g = f$. Then $g = \langle f \times^{(A)} f \rangle^* 1^{\text{RLD}}$.

An (incomplete) attempt to prove one more theorem follows:

THEOREM 2006. Let μ and ν be uniform spaces, $(\text{FCD})\mu$ be a compact funcoid. Then a map f is a continuous map from $(\text{FCD})\mu$ to $(\text{FCD})\nu$ iff f is a (uniformly) continuous map from μ to ν .

PROOF. **FiXme: errors in this proof.**

<http://math.stackexchange.com/questions/665202/bourbaki-on-the-fact-that-continuous-function-on-a-compact-is-uniformly-continuo/670956?iemail=1&noredirect=1#670956>

We have $\mu = \langle (\text{FCD})\mu \times (\text{FCD})\mu \rangle \uparrow^{\text{RLD}} 1^{\text{RLD}}$
 $f \in C_?((\text{FCD})\mu, (\text{FCD})\nu)$. Then

$$f \times^{(A)} f \in C_?((\text{FCD})(\mu \times^{(A)} \mu), (\text{FCD})(\nu \times^{(A)} \nu))$$

$$(f \times^{(A)} f) \circ (\text{FCD})(\mu \times^{(A)} \mu) \sqsubseteq (\text{FCD})(\nu \times^{(A)} \nu) \circ (f \times^{(A)} f)$$

For every $V \in \text{up}(\nu \times^{(A)} \nu)$ we have $\langle g^{-1} \rangle V \in \langle (\text{FCD})(\mu \times^{(A)} \mu) \rangle \{y\}$ for some y .

$$\langle g^{-1} \rangle V \in \langle (\text{FCD})\mu \times^{(A)} (\text{FCD})\mu \rangle \uparrow^{\text{RLD}} 1^{\text{RLD}} = \text{up } \mu$$

$$\langle g \rangle \langle g^{-1} \rangle V \sqsubseteq V$$

We need to prove $f \in C(\mu, \nu)$ that is $\forall p \in \text{up } \nu \exists q \in \text{up } \mu : \langle f \rangle q \sqsubseteq p$. But this follows from the above. \square

FiXme: A space is compact if and only if it is both, complete and totally bounded.

<http://math.stackexchange.com/questions/1101995/non-symmetric-version-of-compact-totally-bounded-complete>

Pointfree functors as a generalization of frames

I define an injection from the set of frames to the set of pointfree endo-functors.
This article is a rough partial draft of a future longer writing.

1. Definitions

1.1. Pointfree functor induced by a co-frame. Let \mathfrak{L} is a co-frame.

We will define pointfree functor $\uparrow \mathfrak{L}$.

Let $\mathcal{B}(\mathfrak{L})$ is a boolean lattice whose co-subframe \mathfrak{L} is. (That this mapping exists follows from [3], page 53.) There may be probably more than one such mapping, but we just choose one \mathcal{B} arbitrarily.

Define $\text{cl}(A) = \prod \{X \in \mathfrak{L} \mid X \supseteq A\}$.

Here \prod can be taken on either \mathfrak{L} or $\mathcal{B}(\mathfrak{L})$ as they are the same.

OBVIOUS 2007. $\text{cl} \in \mathfrak{L}^{\mathcal{B}(\mathfrak{L})}$.

$$\text{cl}(A \sqcup B) = \prod \{X \in \mathfrak{L} \mid X \supseteq A \sqcup B\} = \prod \{X \in \mathfrak{L} \mid X \supseteq A, X \supseteq B\} = \prod \{X_1 \sqcup X_2 \mid X_1 \supseteq A, X_2 \supseteq B\} = \prod \{X_1 \mid X_1 \supseteq A\} \sqcup \prod \{X_2 \mid X_2 \supseteq B\} = \text{cl } A \sqcup \text{cl } B.$$

$\text{cl } 0 = 0$ is obvious.

Hence we are under conditions of the theorem 14.26 in my book.

So there exists a unique pointfree endo-functor $\uparrow \mathfrak{L} \in \text{FCD}(\mathfrak{F}(\mathcal{B}(\mathfrak{L})), \mathfrak{F}(\mathcal{B}(\mathfrak{L})))$ such that

$$\langle \uparrow \mathfrak{L} \rangle \mathcal{X} = \prod_{\mathfrak{F}(\mathcal{B}(\mathfrak{L}))} \langle \text{cl} \rangle \text{up}^{(\mathfrak{F}(\mathcal{B}(\mathfrak{L})), \mathfrak{F}(\mathcal{B}(\mathfrak{L})))} \mathcal{X}$$

for every filter $\mathcal{X} \in \mathfrak{F}(\mathcal{B}(\mathfrak{L}))$.

1.2. Co-frame induced by a pointfree functor. The co-frame $\downarrow f$ for some pointfree endo-functors f will be defined to be the reverse of \uparrow . See below for exact meaning of being reverse.

Let restore the co-frame \mathfrak{L} from the pointfree functor $\uparrow \mathfrak{L}$.

Let poset $\downarrow f$ for every pointfree functor f is defined by the formula:

$$\downarrow f = \{X \in Z(\text{Ob } f) \mid \langle f \rangle X = X\}.$$

REMARK 2008. It seems that \downarrow is *not* a monovalued function from pFCD to $\text{Ob}(\mathbf{Frm})$.

1.3. Isomorphism of co-frames through pointfree functors.

REMARK 2009. $\mathfrak{F}(\mathcal{B}(\mathfrak{L})) = Z(\mathfrak{F}(\mathcal{B}(\mathfrak{L})))$ (theorem 4.137 in [5]).

THEOREM 2010. $\mathfrak{L} \mapsto \downarrow \uparrow \mathfrak{L}$ (where \mathfrak{L} ranges all small frames) is an order isomorphism.

PROOF. Let $A' \in \downarrow \uparrow \mathfrak{L}$. Then there exists $A \in \mathcal{B}(\mathfrak{L})$ such that $A' = \uparrow^{\mathcal{B}(\mathfrak{L})} A$.

$\langle f \rangle A' = \uparrow^{\mathcal{B}(\mathfrak{L})} \text{cl } A$.

$\langle f \rangle A' = A'$ that is $\uparrow^{\mathcal{B}(\mathfrak{L})} \text{cl } A = A' = \uparrow^{\mathcal{B}(\mathfrak{L})} A$. So $\text{cl } A = A$ and thus $A \in \mathfrak{L}$.

Let now $A \in \mathfrak{L}$. Then take $A' = \uparrow^{\mathcal{B}(\mathfrak{L})} A$. We have $\langle f \rangle A' = \text{cl } A = \uparrow^{\mathcal{B}(\mathfrak{L})} A = A'$. So $A' \in \downarrow \uparrow \mathfrak{L}$.

We have proved that it is a bijection.

Because A and A' are related by the equation $A' = \uparrow^{\mathcal{B}(\mathcal{L})} A$ it is obvious that this is an order embedding. \square

2. Postface

Pointfree funcoids are a **massive** generalization of locales and frames: They don't only require the lattice of filters to be boolean but these can be even not lattices of filters at all but just arbitrary posets. I think a new era in pointfree topology starts.

Much work is yet needed to relate different properties of frames and locales with corresponding properties of pointfree funcoids.

Singularities

Very rough draft.

1. Singularities functors: some special cases

We attempt to prove that $\text{up } z$ is closed regarding finite intersections.

For consideration of this, let's consider two special cases (first of which is a specialization of the second).

Let $\mu = \nu$ be the natural proximity on real numbers \mathbb{R} .

Let Δ is the entourage filter of zero.

1. $z = \Delta \times^{\text{FCD}} \Delta$.

2. $z = \nu \circ (\uparrow^{\text{FCD}} f)|_{\Delta}$ for an arbitrary function $f : \mathbb{R} \rightarrow \mathbb{R}$.

(1) is [[also formulated in elementary terms|<http://math.stackexchange.com/questions/568513/is-a-set-closed-under-finite-intersections-about-filters>]] (without using functors).

These two above conjectures are shown to be false by a counter-example in [[this blog post|<http://portonmath.wordpress.com/2013/12/18/a-negative-result-on-a-conjecture/>]]. It is a discouraging result as it seems from it the plain functors can't be used for the multilevel theory of singularities.

2. Using plain functors

This way if we succeed is the best way to create metasingular numbers because, it (if we succeed) involves just functors not some fancy generalization of functors.

Approximate definition of "singularity level": `//Singularity level//` is a transitive, T_2 -separable endofunctor.

Now define the functor $\nu_{i+1} = \text{SLA}(\nu_i)$:

$\text{Ob}(\nu_{i+1})$ is defined as the set of all generalized limits (having fixed μ, ν , and G).

$X [\nu_{i+1}]^* Y \Leftrightarrow \exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists x \in \bigcup X, y \in \bigcup Y : x, y \sqsubseteq K$.

The trouble is to prove that the functor ν_{i+1} exists (is really a functor).

$\neg(X [\nu_{i+1}]^* \emptyset)$ and $\neg(\emptyset [\nu_{i+1}]^* Y)$ are obvious. We need to prove

$$I \cup J [\nu_{i+1}]^* Y \Leftrightarrow I [\nu_{i+1}]^* Y \vee J [\nu_{i+1}]^* Y$$

and

$$X [\nu_{i+1}]^* I \cup J \Leftrightarrow X [\nu_{i+1}]^* I \vee X [\nu_{i+1}]^* J.$$

Let's attempt to prove the first of the above equations (the second is dual).

$I \cup J [\text{SLA}(\nu)]^* Y \Leftrightarrow$

$\exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists x \in \bigcup I \cup \bigcup J, y \in \bigcup Y : x, y \sqsubseteq K \Leftrightarrow$

$\exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z : (\exists x \in \bigcup I \cup \bigcup J : x \sqsubseteq K \wedge \exists y \in \bigcup Y : y \sqsubseteq K) \Leftrightarrow$

$\exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists x \in \bigcup I \cup \bigcup J : x \sqsubseteq K \wedge$

$\exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists y \in \bigcup Y : y \sqsubseteq K \Leftrightarrow$

??

$\exists z \in \bigcup \text{Ob } \nu : (\forall K \in \text{up } z \exists x \in \bigcup I : x \sqsubseteq K \vee$

$\forall K \in \text{up } z \exists x \in \bigcup J : x \sqsubseteq K) \wedge \exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists y \in \bigcup Y : y \sqsubseteq K \Leftrightarrow$

$(\exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists x \in \bigcup I : x \sqsubseteq K \vee$

$\exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists x \in \bigcup J : x \sqsubseteq K) \wedge \exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists y \in \bigcup Y : y \sqsubseteq$

$$\begin{aligned}
& K \Leftrightarrow \\
& (\exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists x \in \bigcup I : x \sqsubseteq K \wedge \exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists y \in \bigcup Y : y \sqsubseteq K) \vee \\
& (\exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists x \in \bigcup J : x \sqsubseteq K \wedge \exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z \exists y \in \bigcup Y : y \sqsubseteq K) \Leftrightarrow \\
& (\exists z \in \bigcup \text{Ob } \nu : (\forall K \in \text{up } z \exists x \in \bigcup I : x \sqsubseteq K \wedge \forall K \in \text{up } z \exists y \in \bigcup Y : y \sqsubseteq K)) \vee \\
& (\exists z \in \bigcup \text{Ob } \nu : (\forall K \in \text{up } z \exists x \in \bigcup J : x \sqsubseteq K \wedge \forall K \in \text{up } z \exists y \in \bigcup Y : y \sqsubseteq K)) \Leftrightarrow \\
& (\exists z \in \bigcup \text{Ob } \nu : (\forall K \in \text{up } z : (\exists x \in \bigcup I : x \sqsubseteq K \wedge \exists y \in \bigcup Y : y \sqsubseteq K))) \vee \\
& \exists z \in \bigcup \text{Ob } \nu \forall K \in \text{up } z : (\exists x \in \bigcup J : x \sqsubseteq K \wedge \exists y \in \bigcup Y : y \sqsubseteq K) \Leftrightarrow \\
& I [\text{SLA}(\nu)]^* Y \vee J [\text{SLA}(\nu)]^* Y.
\end{aligned}$$

To finish the proof we need to fulfill ?? in the above formula. For this it's enough to prove

$$\begin{aligned}
& \forall K \in \text{up } z \exists x \in \bigcup I \cup \bigcup J : x \sqsubseteq K \Rightarrow \\
& \forall K \in \text{up } z \exists x \in \bigcup I : x \sqsubseteq K \vee \forall K \in \text{up } z \exists x \in \bigcup J : x \sqsubseteq K. \\
& \text{If } z = \uparrow Z \text{ is a principal funcoid, then} \\
& \forall K \in \text{up } z \exists x \in \bigcup I \cup \bigcup J : x \sqsubseteq K \Rightarrow \\
& \exists x \in \bigcup I \cup \bigcup J : x \sqsubseteq z \Rightarrow \\
& \exists x \in \bigcup I : x \sqsubseteq z \vee \exists x \in \bigcup J : x \sqsubseteq z \Rightarrow \\
& \forall K \in \text{up } z \exists x \in \bigcup I : x \sqsubseteq K \vee \forall K \in \text{up } z \exists x \in \bigcup J : x \sqsubseteq K.
\end{aligned}$$

Following the idea of [[the proof in this [math.stackexchange.com question|http://math.stackexchange.com/questions/562908/an-implication-involving-filters#562974](http://math.stackexchange.com/questions/562908/an-implication-involving-filters#562974)]] it is easy to show that our implication is true if $\text{up } z$ is closed regarding finite meets. See [[this page|Singularities funcoids: some special cases]] for attempts to set it true. The question is whether our statement holds for non-principal funcoids. Or is there a counterexample?

3. Singularities funcoids: special cases proof attempts

To prove that $\text{GR}(\Delta \times^{\text{FCD}} \Delta)$ is closed under finite intersections, it's enough to prove that for every $f \in \text{GR}(\Delta \times^{\text{FCD}} \Delta)$ there is a positive ε such that $\forall x \in]-\varepsilon; \varepsilon[: fx \in \Delta$.

Really, under this assumption:

For $g \in \text{GR}(\Delta \times^{\text{FCD}} \Delta)$ exists $\zeta > 0$ such that $\forall x \in]-\zeta; \zeta[: gx \in \Delta$. Let $\eta = \min\{\varepsilon, \zeta\}$. So $\forall x \in]-\eta; \eta[: (\langle f \rangle x \in \Delta \wedge \langle g \rangle x \in \Delta)$ and so $\forall x \in]-\eta; \eta[: \langle f \cap g \rangle x \in \Delta$ that is $\forall x \in]-\eta; \eta[: \langle \uparrow^{\text{FCD}} (f \cap g) \rangle^* \{x\} \sqsupseteq \Delta$ and consequently $f \cap g \in \text{GR}(\Delta \times^{\text{FCD}} \Delta)$.
