## Abstract

I define **connectors** and **generalized connectedness** which generalizes topological connectedness, path connectedness, connectedness of digraphs, proximal connectedness, uniform connectedness, and some other kinds of connectedness. This article also serves as a simple introduction for my future writings where I will consider more difficult topic of filters connected regarding funcoids and reloids.

*Keywords:* connected, connectedness, disconnected, disconnectedness, path connectedness, connectivity, connected space, disconnected space
